

26 February 2019

Milling Wheat Conference

In association with **nabim** and incorporating the YEN Wheat Quality Award

Programme

- 10:40** Varieties and disease – an integrated approach; Jenna Watts, AHDB
- 11:00** Managing wheat crops for quality; Sarah Clarke, ADAS
- 11:20** Growing for the market; James Price, Perdiswell Farm
- 11:40** Refreshment break
- 12:00** Capturing and maintaining quality – storage and drying; Philip Darke, Camgrain
- 12:20** Miller panel discussion;
 - Dr Simon Penson, ADM Milling UK Ltd
 - Julius Deane, Carr's Flour Mills Ltd
 - George Mason, Heygates Ltd
 - Stuart Bradshaw, EB Bradshaw & Sons
- 13:00** Lunch

Programme

13:45 Baking and consumers; Eva Wheeler, Allied Bakeries

14:15 YEN Wheat Quality Award

- Introduction to YEN – Roger Sylvester-Bradley, ADAS
- Explanation of Award Testing – Mark Charlton, Allied Technical Centre
- Presentation of Awards – George Marriage, Marriage's Millers
- Winner Introductions – Video biographies
- Winners Question and Answer Panel

15:20 Conference close; Martin Grantley-Smith, AHDB

15:30 Depart

Varieties and disease – an integrated approach

Jenna Watts - AHDB

Outline

- The importance of varietal disease resistance
 - Role of disease resistance within the RL
- New winter wheat milling varieties on the RL
- Planning for the future of the RL – what are your priorities?

Important of varietal disease resistance

An integrated approach to disease control

Current methods of disease control impacted by:

- Legislative change
- Development of resistance

Pesticide input is only one aspect of crop management:

- Selection of resistant/tolerant varieties
- Good hygiene
- Cultivation techniques
- Rotations
- Monitoring
- Sowing dates

Varietal resistance

- Independent information from the RL

RL Disease ratings

Annual monitoring:

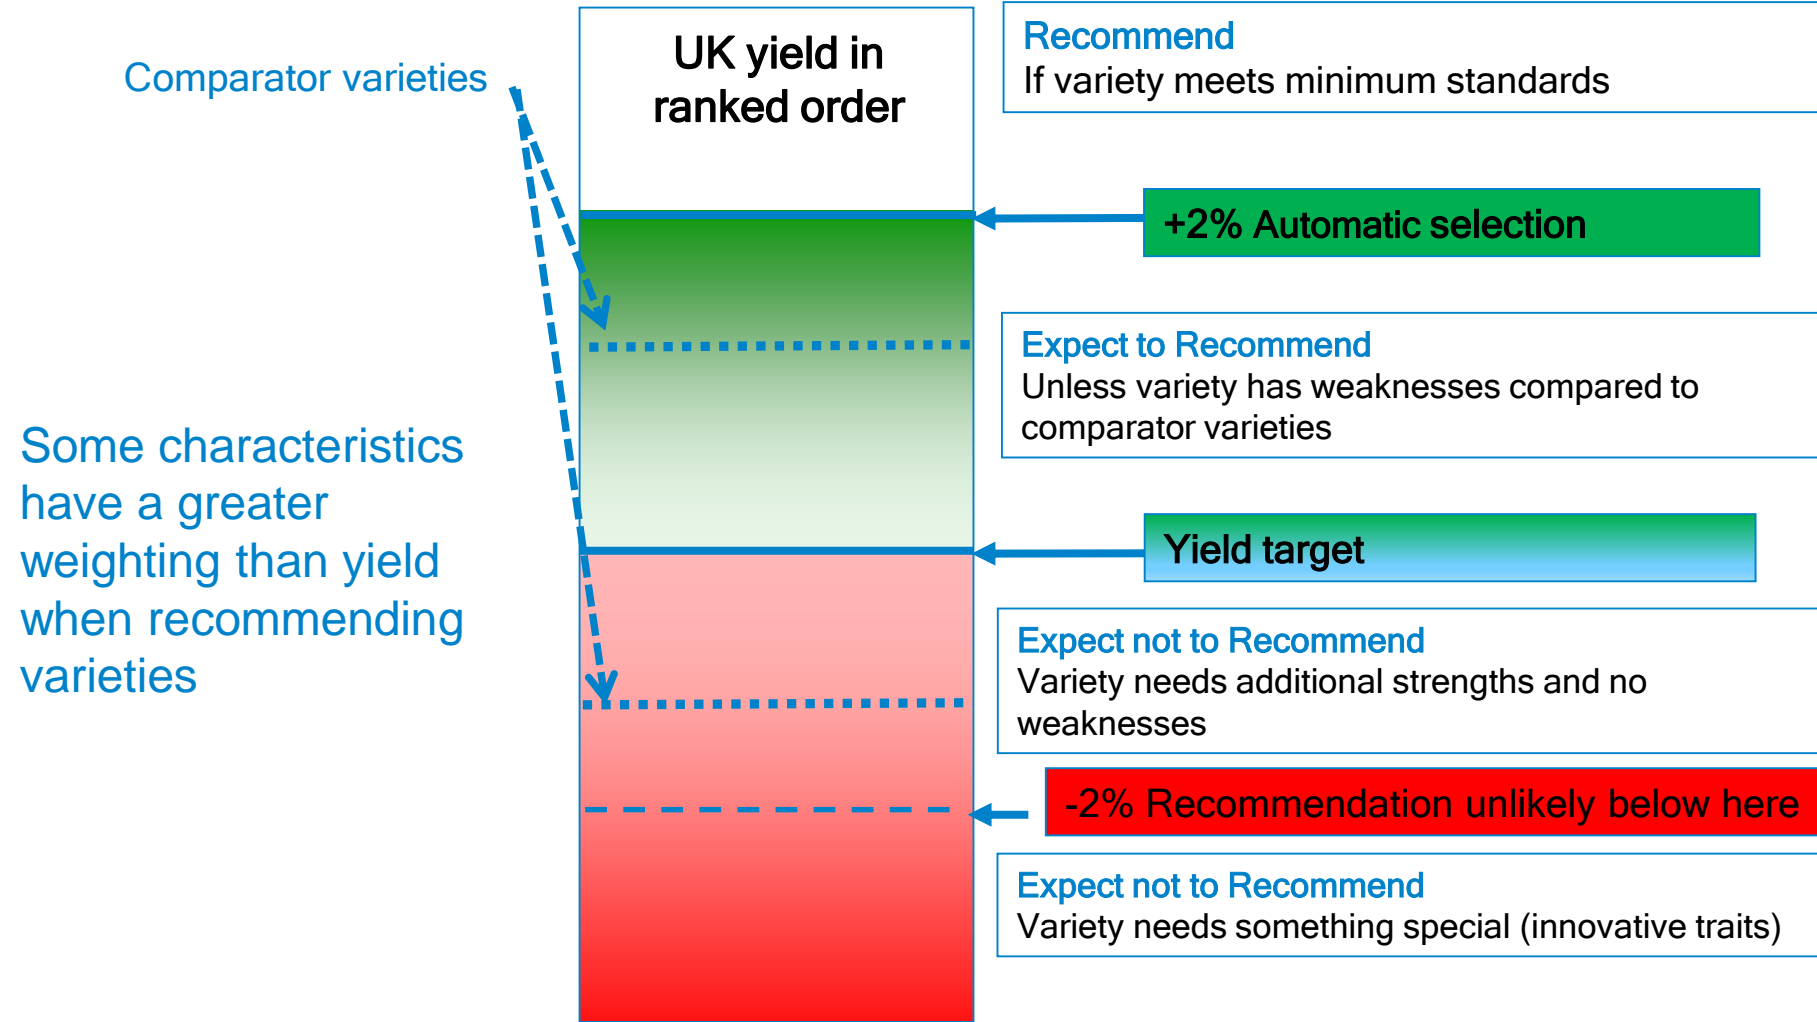

- Untreated trials
- Disease observation plots
- Inoculated trials

Normally 3-5 years of data used in rating calculations

| Winter wheat 2019/20 | | | | | | | | | | | | | | | | |

Criteria for Recommendation

Does the variety have a balance of features that are sufficiently better than existing varieties & such that it could potentially provide a more economic return in the market?

Importance of disease resistance

- For recommendation decisions (reviewed annually)

Comparator characteristics for Group 1 and Group 2 winter wheat varieties (July 2018; subset)

| Variate | Importance | Target specification |
|--|------------|----------------------|
| UK treated yield | High | |
| UK untreated yield | Med | |
| Millers assessment | V. high | |
| Potential for ukp | High | |
| Protein content | Med | |
| HFN | High | 230 |
| Specific weight | High | 75 |
| Combination of untreated yield & disease score | High | |

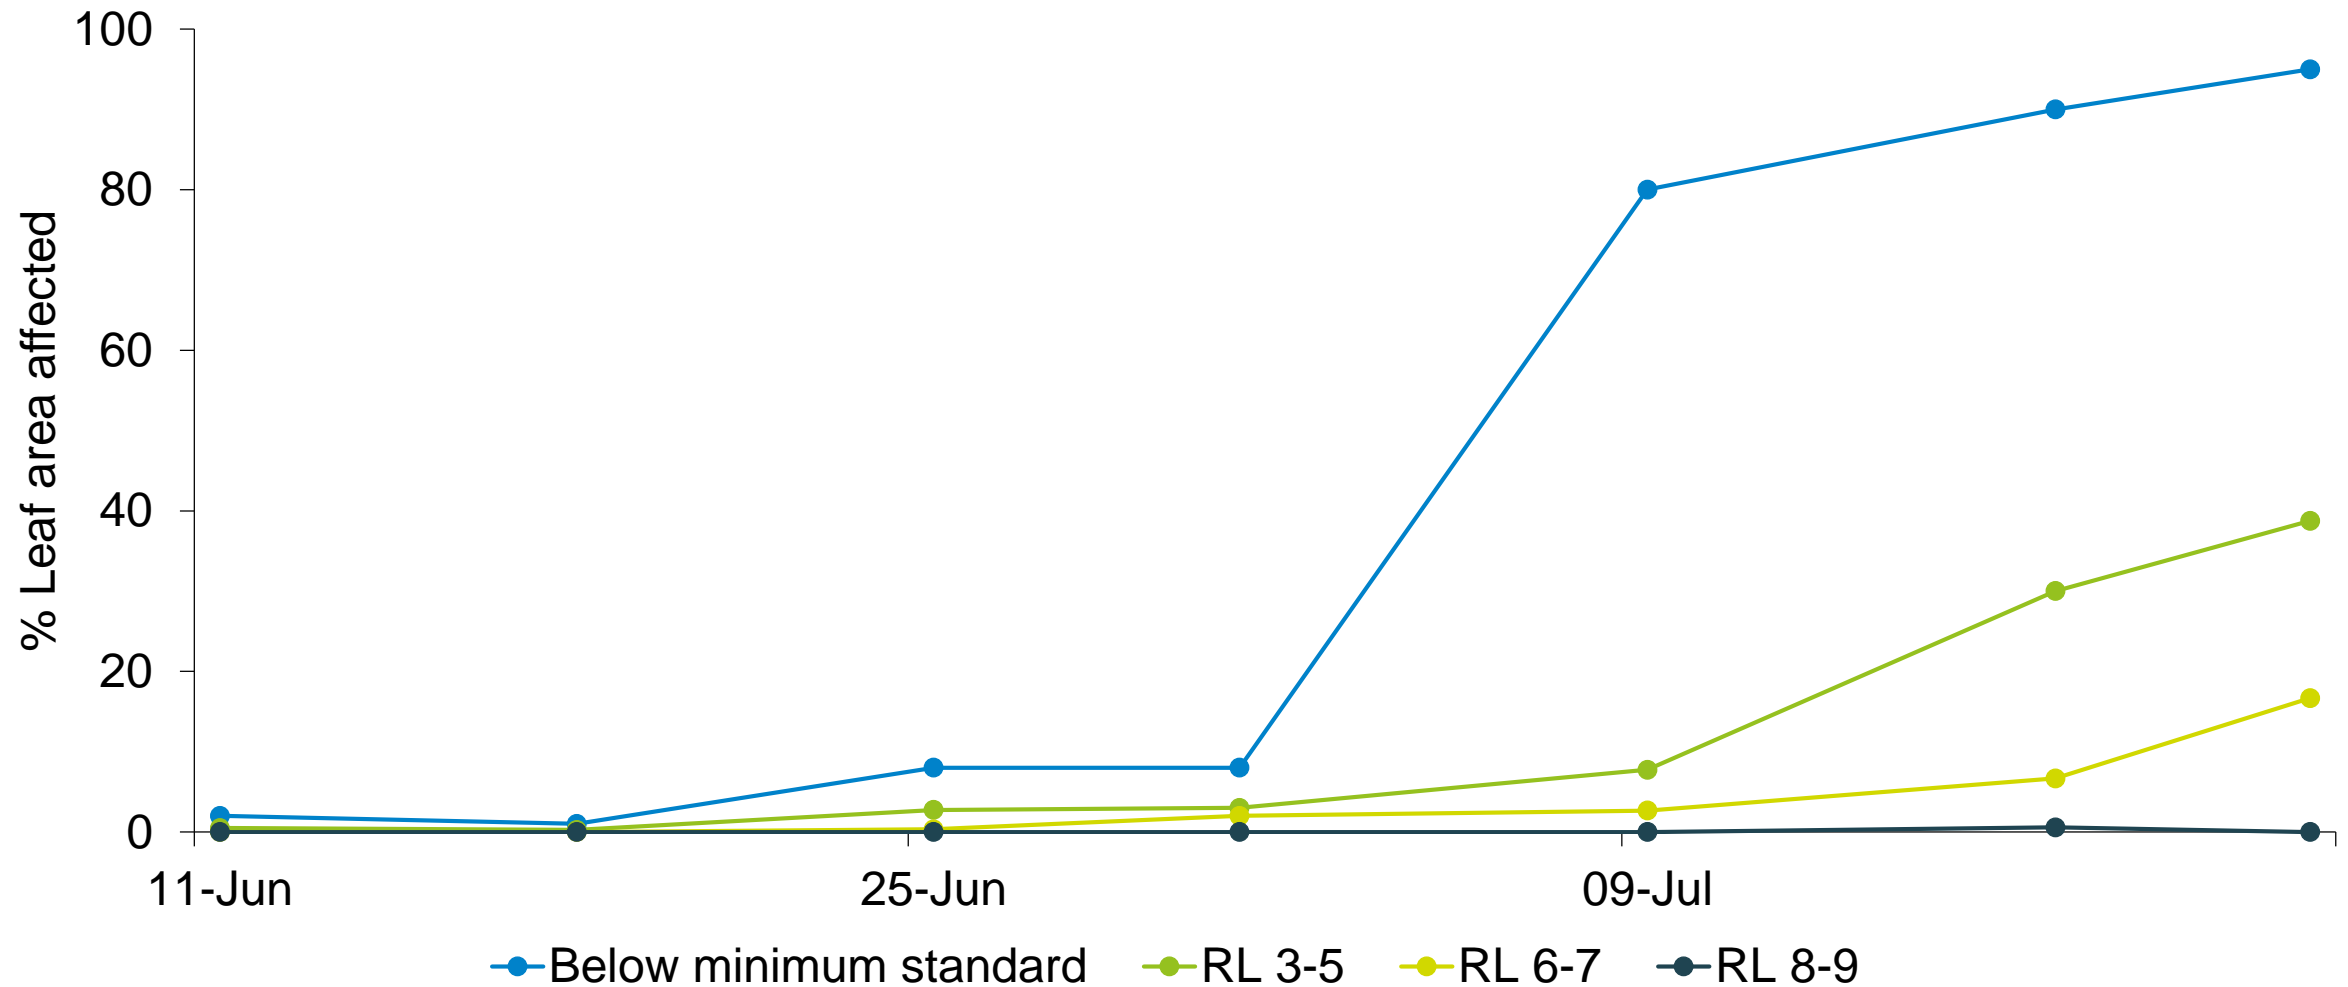

| Variate | Importance | Minimum standard |
|------------------|------------|------------------|
| Septoria tritici | V. high | 4* |
| Yellow rust | High | 3 |
| Brown rust | Medium | 3 |
| Eyespot | Medium | 3 |
| Fusarium | Medium | 3 |
| Mildew | Medium | 3 |
| Septoria nodorum | Low | 3 |
| OWBM | High** | |

* 5.0 for automatic recommendation

** If reliable data available

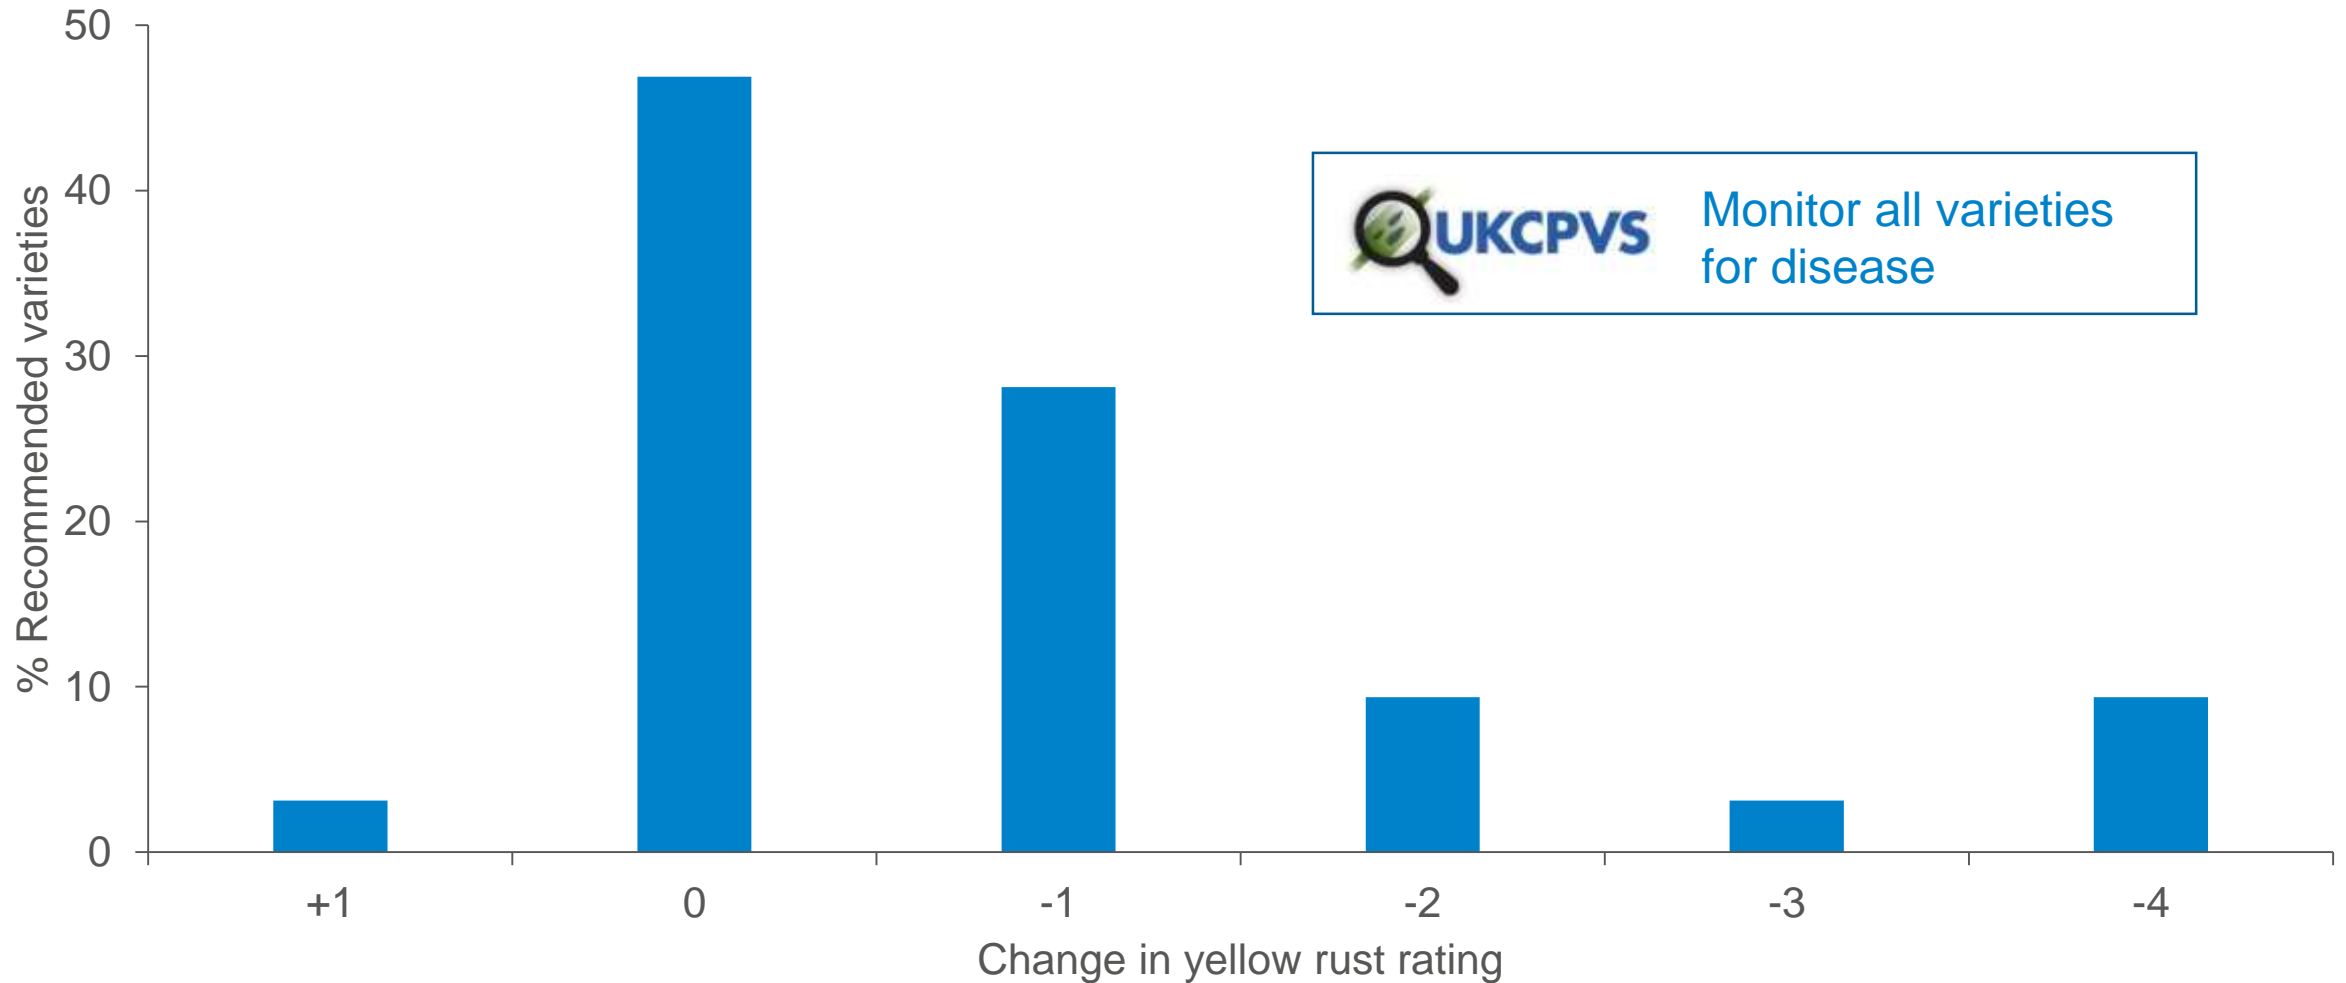

Minimum standards

- Yellow rust development

Durability of resistance

- Yellow rust changes in RL ratings between 2015 and 2016

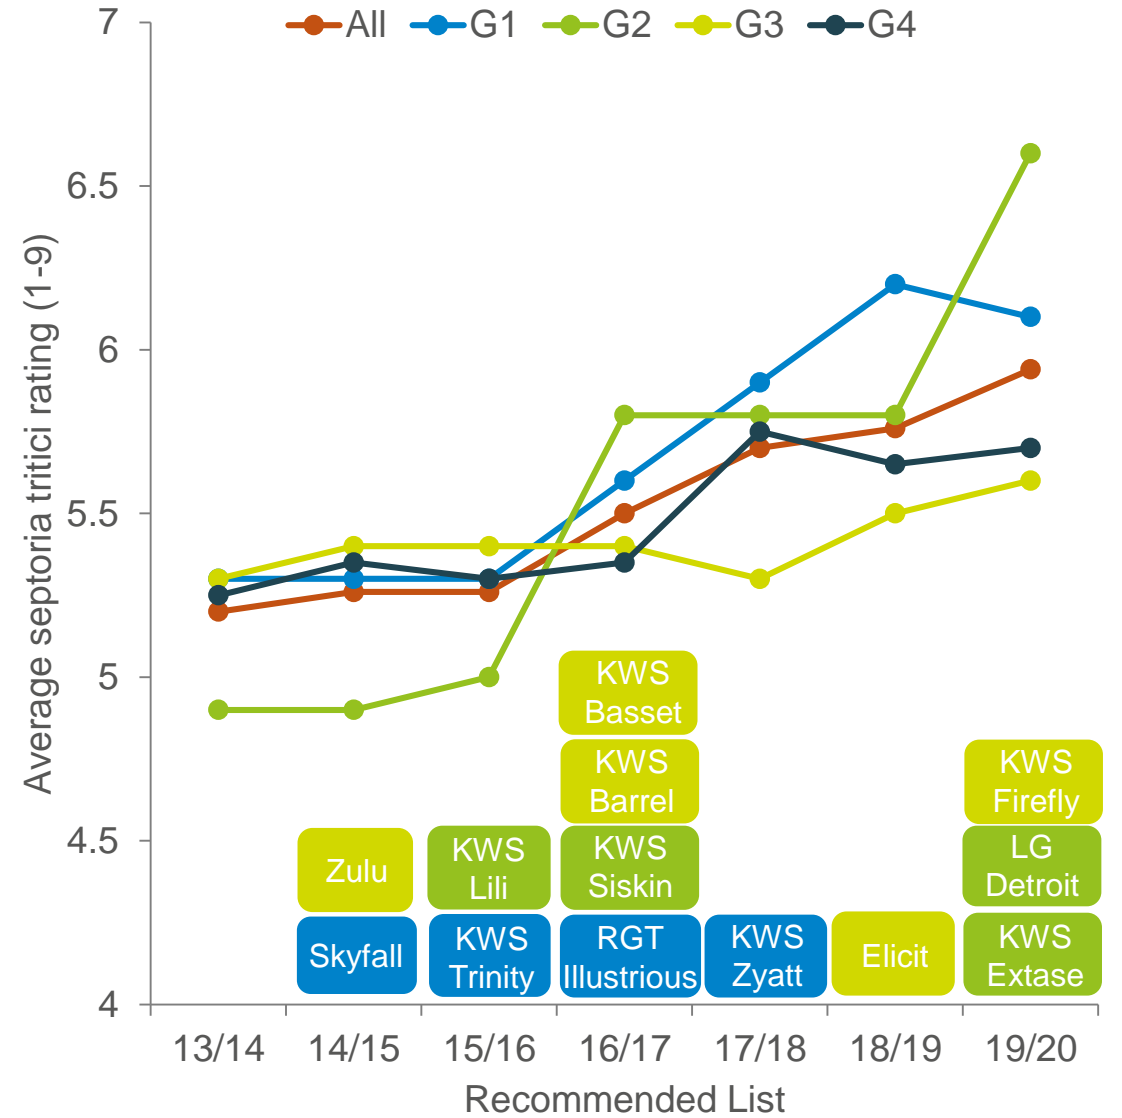

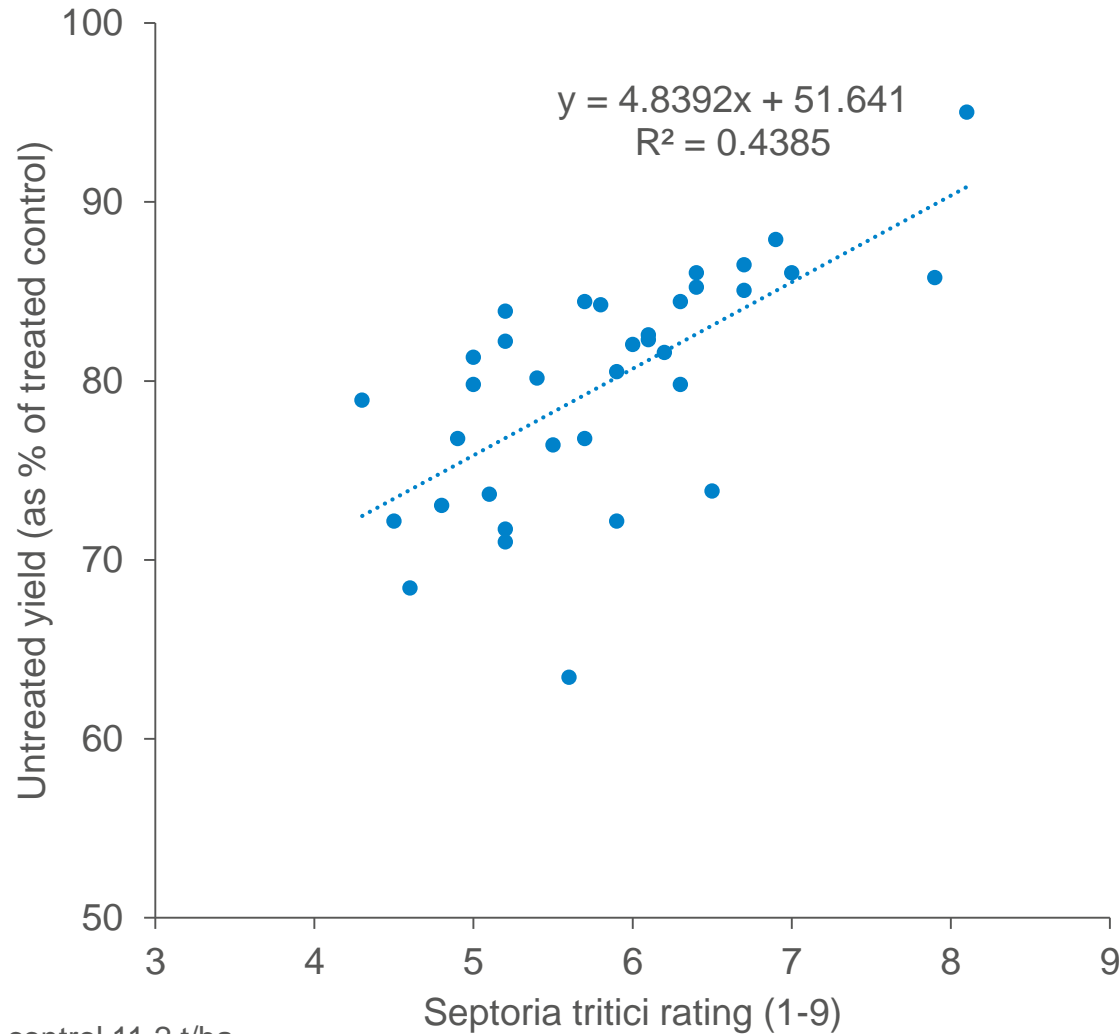

Durability of resistance

- *Septoria tritici*

- RL disease ratings are currently stable
- Average change between 2018/19 and 2019/20 RL was -0.01 rating

Value of septoria tritici resistance

2019/20 Recommended List

AHDB Recommended List 2019-20

| Crop | New varieties | Varieties removed |
|---------------------|---------------|-------------------|
| Winter wheat | 5 | 11 |
| Spring wheat | 2 | 1 |
| Winter barley | 6 | 2 |
| Spring barley | 1 | 0 |
| Winter oats | 0 | 3 |
| Spring oats | 1 | 2 |
| Winter oilseed rape | 9 | 4 |
| Total | 24 | 23 |

New winter wheat

Planning for the future of the RL

What are your priorities?

RL Look Ahead activities

- Survey
- Meetings with growers and agronomists
- Formal Committee and Board meeting
- Discussions at events

In total 623 responses

What characteristics are important to growers?

Grower & Agronomist response

Other stakeholder response

Most crucial for millers

Summary

- Disease resistant and tolerant varieties are a valuable tool in an integrated disease management programme
- Monitoring activities are important as disease populations can rapidly change
- Disease resistance is an important characteristic for recommendation
- It is possible for a variety with good disease resistance to be recommended if it has not met the yield target
- RL Look Ahead activities have highlighted the importance of disease resistance

Managing wheat crops for quality: finding the farm factor

Sarah Clarke

Crop Physiologist, ADAS

sarah.clarke@adas.co.uk

CEREALS & OILSEEDS

Outline

- YEN 2017 vs 2018 results
- Getting protein right through nutrition:
 - Insights from LearN project
 - Understanding your N requirements with tramline trials
 - New research on milling wheat nutrition
- Conclusions and looking forward to 2019

Enhancing Yield AND Quality – YEN data

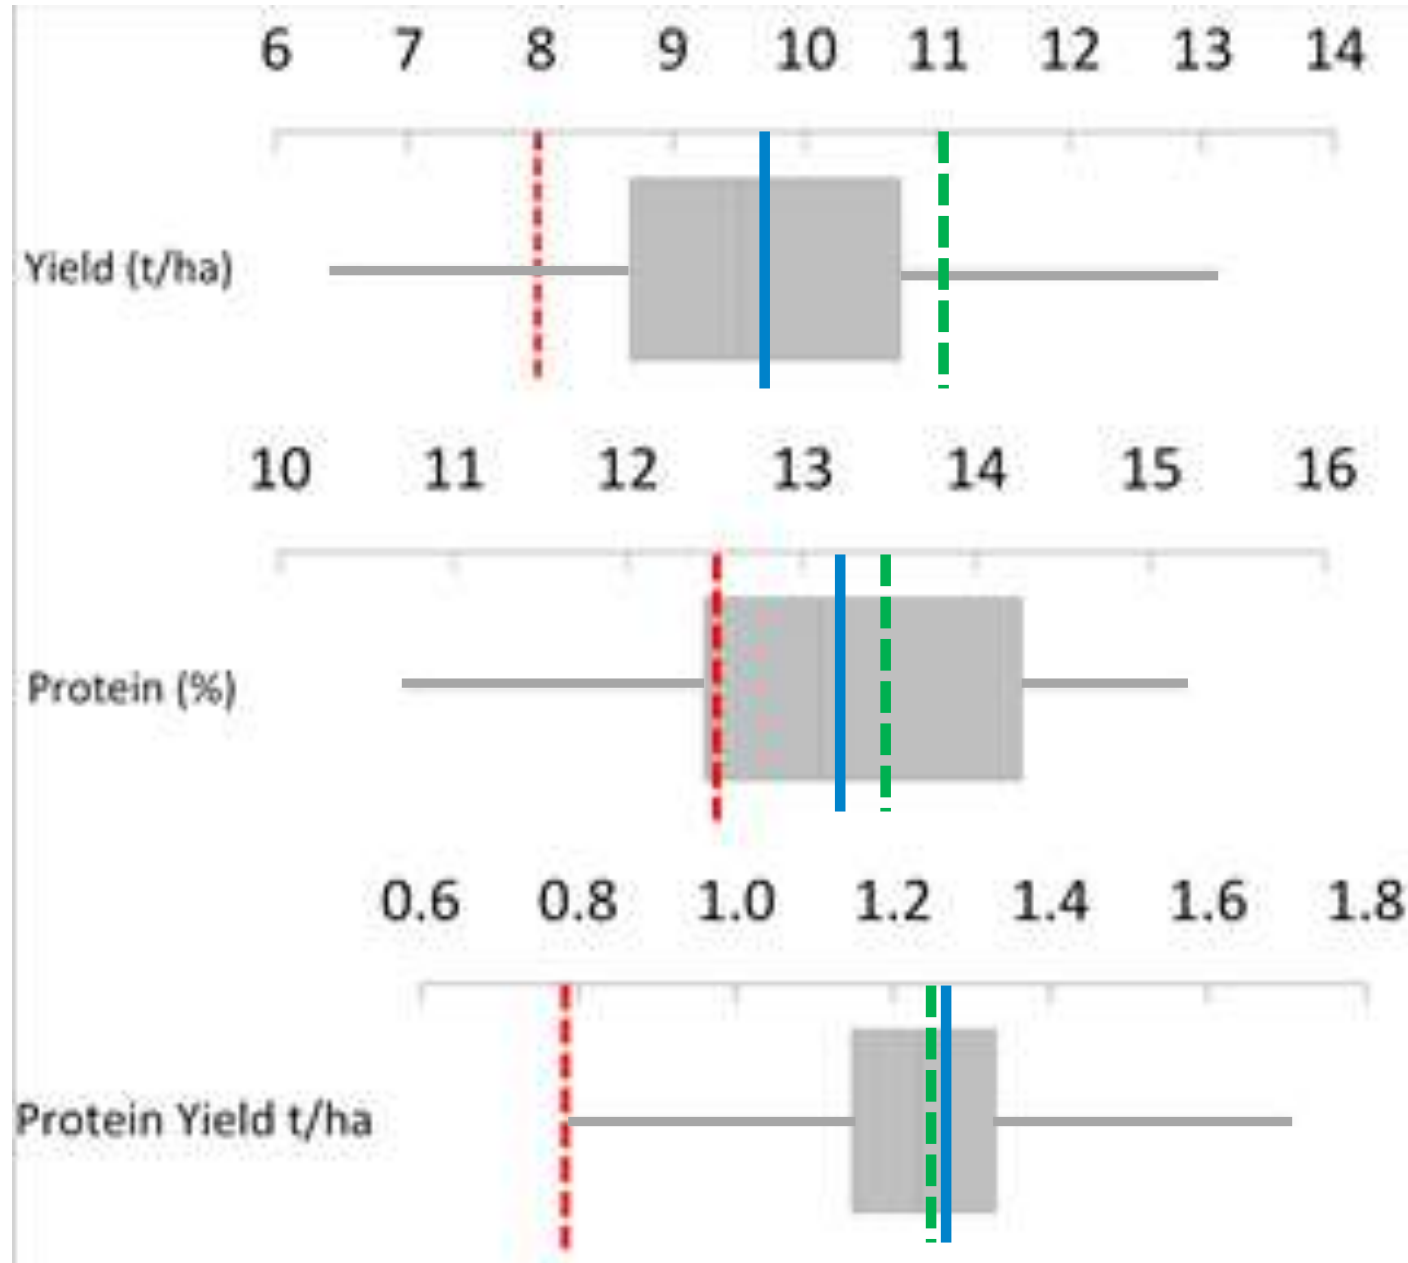

- Achieving high yields and milling quality ‘Holy Grail’
- Challenge of growing milling wheats acknowledged in milling premiums
- YEN aims to help growers through:
 - Understanding
 - Benchmarking
 - Supporting innovation
- 2017 was first year of Quality YEN
 - 25 Quality YEN entrants
- 2018 saw 32 Quality YEN entrants

YEN Benchmarking

Quality YEN results – 2018 vs. 2017

Features of the 2018 growing season

- Water limitation key feature of 2018
 - But where soils held sufficient water very high yields possible
 - High temperatures led to early senescence and harvest
 - Lower proteins because late uptake hampered?
-
- Soil and weather only explains a small part of yield variation – ‘Farm Factor’ is dominant

- To enable individual farms to determine whether, on-average, their N use on wheat is about right ...
... or too much ... or too little.

Approach

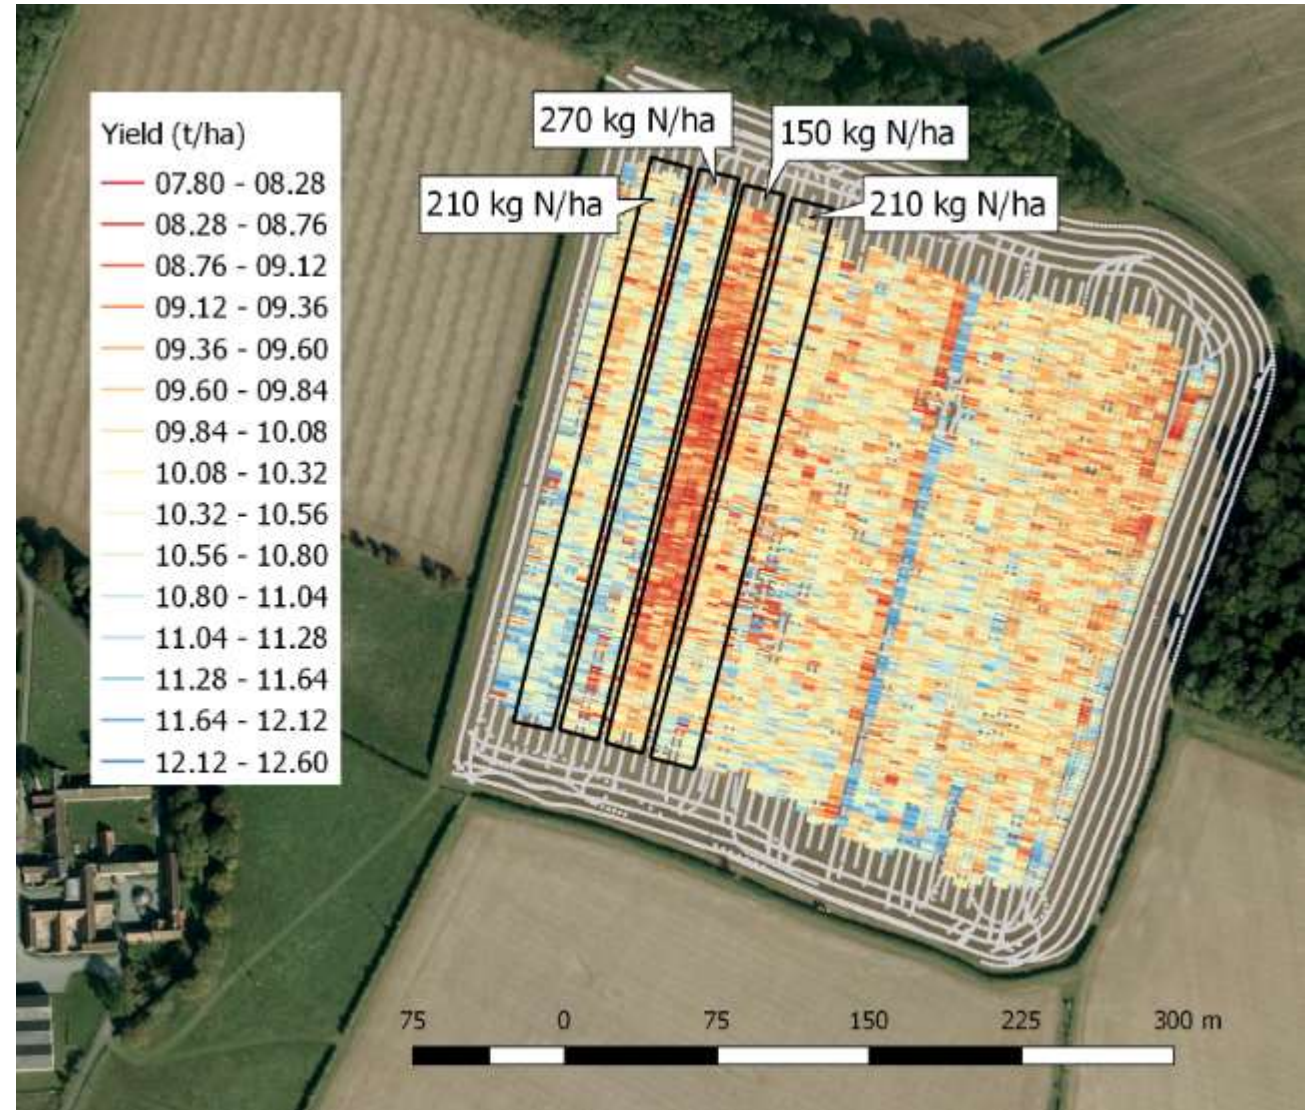

- Full N response experiments alongside strip trials on 6 farms ... in East, similar soils & systems
- Strip trials on additional 12 farms
- 3 fields per farm for 4 years

Tramline Comparisons

- Farm standard N rate, +60 kg/ha, -60kg/ha
- Yield from mapping data
- Manual grain protein samples
- At current grain & fertiliser prices need 0.3t/ha grain to pay for 60 kg N/ha fertiliser
 - Calculate margins
 - Use standards to judge inherent variation

| | N rate kg/ha | Yield t/ha | Margin over N cost £/ha | Protein %DM |
|----------|-----------------|------------|-------------------------------|----------------|
| Standard | 210 | 9.16 | £1135 | 10.22 |
| High | 270 | 9.43 | £1131 | 11.20 |
| Low | 150 | 8.49 | £1084 | 8.99 |
| Standard | 210 | 8.99 | £1112 | |

LearN findings

- In using ~240 kg N/ha on average, the farms were getting their N rates broadly right
- There is a large 'farm factor'
- Protein a useful indicator of N responsiveness
 - Slopes were relatively consistent across ~150 trials
- LearN was focusing predominantly on yield

- Tramline trials can be useful ... but care must be taken
 - ADAS have developed a guide to on-farm trials
- There is a movement towards 'Farmer-Centric Research'
 - Farmer Innovation Groups (FIGs) are working to set up co-ordinated on-farm measures and tests
- Opportunity for a milling wheat FIG?
 - Could investigate the economic and quality value of applying urea late N

New AHDB project on milling wheat fertilisation

Aims:

- Update guidance on nitrogen and sulphur fertiliser use for winter milling wheat
- To achieve optimum grain quality and milling specifications for a range of varieties, soil types and growing environments.

Led by NIAB

Duration: July 2018 – March 2022

Trial sites in East Anglia and Scotland to test effects of N and S applications (including foliar) on quality including rheology and baking quality

Summary

- The 2018 season affected the results of the Quality YEN entries, although average proteins were still $>13\%$
- A 'farm factor' affects grain protein
- On-farm tramline trials may be a useful tool for milling wheat growers
- New research aims to improve specific milling wheat N and S recommendations
- More entries over more seasons will give us greater understanding of getting the best out of milling wheats

Growing for the market

James Price – Perdiswell Farm

The Farm

- 480ha of Cotswold Brash Soils plus 200ha heavy(ish) clay
- Annual Rainfall 580mm
- 1 Full time member of staff plus part time help
- 140ha owned - remainder tenanted & contract farmed

The Farmer

- 40 years old
- Failed to stay at College long enough to get a degree
- Sit on AHDB Cereals and Oilseeds Board & Chair the R & KT Committee
- Chair Arable Technical Working Group for the revision of RB209
- Habit of appearing in the press

Challenges

- Family farm
- Soils
- Market
- Land ownership
- Weather
- New ideas
- Weed Pressure

Liebig's Barrel

The Solution

- Milling wheat
- Do something completely different!

Varieties

- Started with Hereward
- Tried Solstice
- Quickly went from Crusoe to Skyfall
- Always had a stable Group 2 as a second variety
- Until last year...

Nutrition

- Aim for total of 240kg N
- No bagged P and K for over 10 years
- 4 Splits – Liquid N+S then solid AN
- Challenge of no Nufol for Warburtons
- N-Sensor used throughout

Nutrition

Nutrition

- Blues – Variable Rate
- Greens – Flat Rate

Nutrition

1st Application

2nd Application

3rd Application

4th Application

Nutrition

- Fresh P and K
- What is my limiting factor?

Fungicide Strategy

- Do I have a choice?
- T0 if necessary, not for past 2 years
- T1 – SDHI plus CTL
- T2 – SDHI plus azole/CTL
- T3 – Azole, cheap/expensive depending on season

Harvest Management

- Combining
- Drying
- Storage

Marketing

- Group Cereals – Centaur – Openfield
- Warburtons
- Price+ Contracts where possible
- 50:50 Group 1 and 2
- Mix of pools, forward sales and spot price
- August 18 - £205/t

Am I doing anything differently?

- Organic Manures
- Precision Farming
- Net Margin Maps
- Cover Crops with Livestock

Organic Manures

Precision Farming

- N-Sensor
- Database of soil analysis alongside OM tests
- Autosteer
- Telematics
- Wireless Data Transfer

Normalised Yield Variation Maps

Cover Crops

The Future

- Varieties
- Loss of actives
- Contracts
- New Land
- Marginal Land removal
- Should I just be aiming to grow a 7t crop?

Capturing and maintaining quality – storage and drying

Philip Darke – Camgrain Stores Ltd

Farm and Customer Requirements

- Variety Selection
- When do I intend to combine the crop?
 - at the start of harvest
 - at the end of harvest
- Combine and drying capacity
- What is the target market for the crop?
 - premium – milling wheat / malting barley
 - feed
 - a mix of the above
- How robust is harberg / quality retention?

Premium crops

- Combine promptly
 - within 7 days of optimum
 - depending on weather
 - ambient temperature
 - moisture
 - crop maturity

How robust is my system for crop storage?

- Great in a dry year
- Wet harvest
 - I sit on the side of the field and wait for good weather
 - Yield and quality sliding
 - Premium for quality going up
- Store cleaning down programme
 - use of pre harvest chemicals
 - use of post harvest chemicals
- Laboratory and sampling procedures
 - moisture, germination, mycotoxins, ergot
- Segregation
- Moisture measurement crucial
 - calibration of moisture meters / laboratory equipment
 - does the moisture go up in store?

Drying options

- High temperature drying
- Bulk drying

High temperature grain drier

- Holding capacity
 - with aeration / without aeration
- Dry capacity
- Read the drier manual!
- Servicing and preparation – crucial
 - clean out drier
 - first fire opportunity
 - grain hung up from last year
 - Insect infestation opportunity for new crop
- Operation and calibration of burners
- Temperature gauges
 - air on – do not exceed!
 - grain temperature – do not exceed!
- Can you dry in one pass?
 - don't run drier too slow!
 - fire hazard
 - blend and aerate carefully to drier where possible – steady speed
 - for fuel efficiency avoid running drier taking small % moisture out

Post drier action

- Cool
 - careful use of power
 - temperature differential? high / low
 - reduce from 30°C plus asap
- Eliminate temperature gradients
- Avoid sweating of silo and flat store
- Storage term – 1 month, 11 months, overyearing?
- Target temperature 5°C, 10°C, 15°C?
- Start fan as soon as possible after harvesting and average outside air temperatures are at least 5°C cooler than the grain in the bin
- Important if large moisture and / or temperature variations
- Ideal grain temperature is 5-10°C during the entire storage period

No
ventilation

Which air flow direction should be used?

- Upward flow
 - Fan blows air into the duct (traditional method)

- Downward flow
 - Fan sucks the air (used under special conditions)

How aeration systems work?

Importance of cooling front

Bulk Drying

- Bulk Drying
 - How long to dry?
 - Accurate moisture measurement
- Monitoring
 - Regular in bulks / how regular?
- Insects
 - gestation period
 - temperature
 - more insects everywhere
 - how good was cleaning program, will find out end of October ish!
- Temperature monitoring
 - automate if possible
 - calibration of systems

Principles of Aeration and Drying

I: Cold and dry ambient air

1: A: Air condition

2: C: Grain condition

Drying of grain occurs in both the temp. and moisture fronts

A: Zone A

B: Zone B

A-B: Moisture/drying front

C: Zone C

B-C: Temperature front

Psychrometric Chart

SI (metric units)
Barometric Pressure 101.325 kPa (sea level)
based on data from
Carrier Corporation Cat. No. 794-001, dated 1975

Why should the fan be sealed when not being used?

Autumn and Winter

Spring and summer

Bulk capping / mould formation

- Temperature front didn't make it.
- Moulding started before aeration was completed.
- All points of the temperature front must get all the way through the grain

Managing bulks

Chaff, broken kernels or dirt

- Condition can be corrected by keeping the grain levelled or coring the grain.
- Lower than 15°C air has limited air holding capacity. Therefore, night air will not dry grain, but can cool grain.
- The best drying condition of the ambient air is decided by the combination of both air temperature and relative humidity. Not only the air temperature.

Important points

- Always act promptly
- Risk Assess - how large is bulk
- Attention to detail
- Good hygiene practices - effective pest control, clean up spills

Golden Rules

- Aeration - Most crops can be held with good ventilation
- Segregation – Avoid contamination e.g Ergot, mycotoxins, fusarium, other crops
- Water tight - - a water leak, roof or silo. Difficult to spot, can be catastrophic.

Miller Panel Discussion

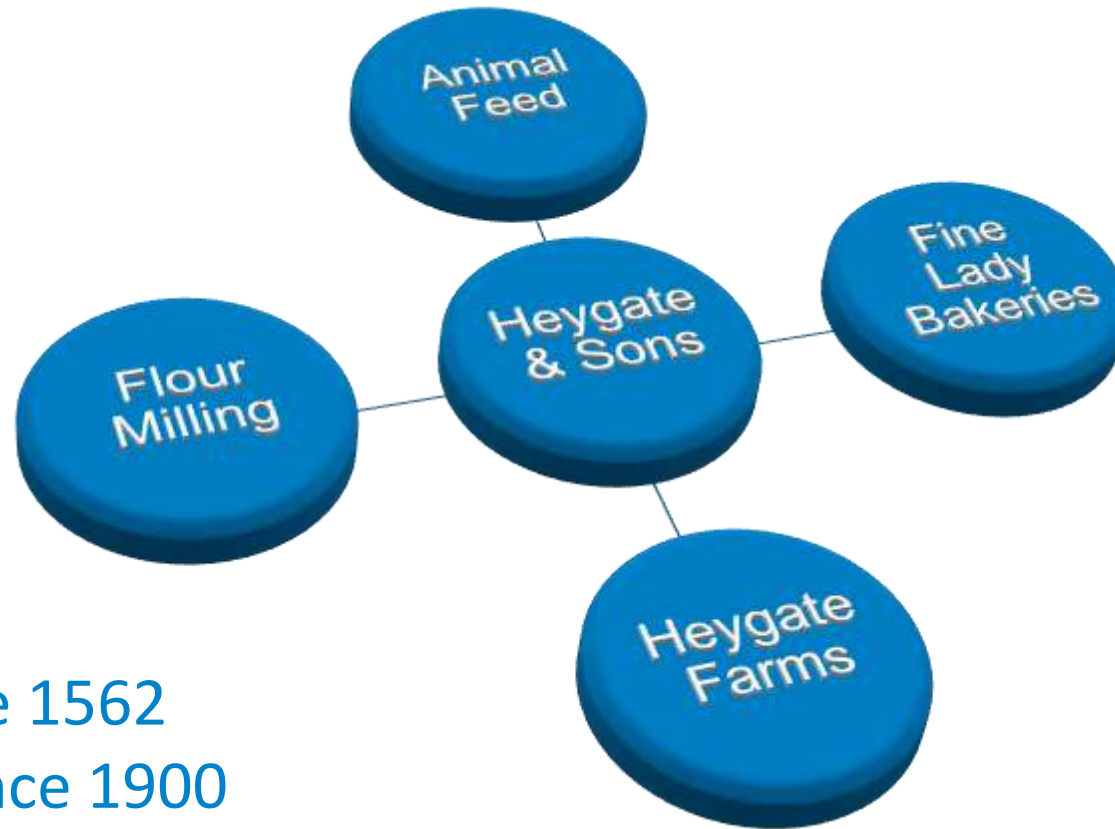

Heygates – the UK milling Industry

George Mason

Heygate Group

Farming since 1562

Milling since 1900

Baking since 1965

Milling wheat sector

- One of the oldest & traditional UK Industries
- Although consolidating it is a reliable, solid market:
 - 29 companies operating 48 mills
 - 5 million tonnes / year worth over £1.25 billion in annual turnover

Flour demand

Key statistics

5 million tonnes of wheat milled each year

£1.25 billion annual turnover

130 million slices of bread

5 million packets of biscuits

4.5 million cakes and buns

2 million pizzas

made from British Flour, are purchased in the UK everyday

BREAD MOST POPULAR ITEM BOUGHT IN BRITAIN

99.8% HOUSEHOLDS BUY BREAD

MORE PEOPLE IN BRITAIN BUY BREAD THAN TOILET PAPER

STRENGTHENING BRITAIN'S ECONOMY

5 million tonnes of wheat milled each year

£1.25bn annual turnover

130 million SLICES OF BREAD

5 million PACKETS OF BISCUIT

4.5 million CAKES & BUNS

2 million PIZZAS

MADE FROM BRITISH FLOUR ARE PURCHASED IN THE UK EVERYDAY

All Grades & Varieties required

Group 1
Group 2
Group 3
Group 4 Hard
Group 4 Soft

% Market Share

Milling Wheat Premium

Political Freedom

Wheat €95.00 per tonne, Flour €172.00

Carr's Flour Mills – getting the best out of wheat

Julius Deane

Carr's Flour Mills

Soft wheat – UK supply

Certified Seed harvested 2018 – England & Wales

Soft wheat – UK supply

Estimated plantings for Harvest 2019 - UK

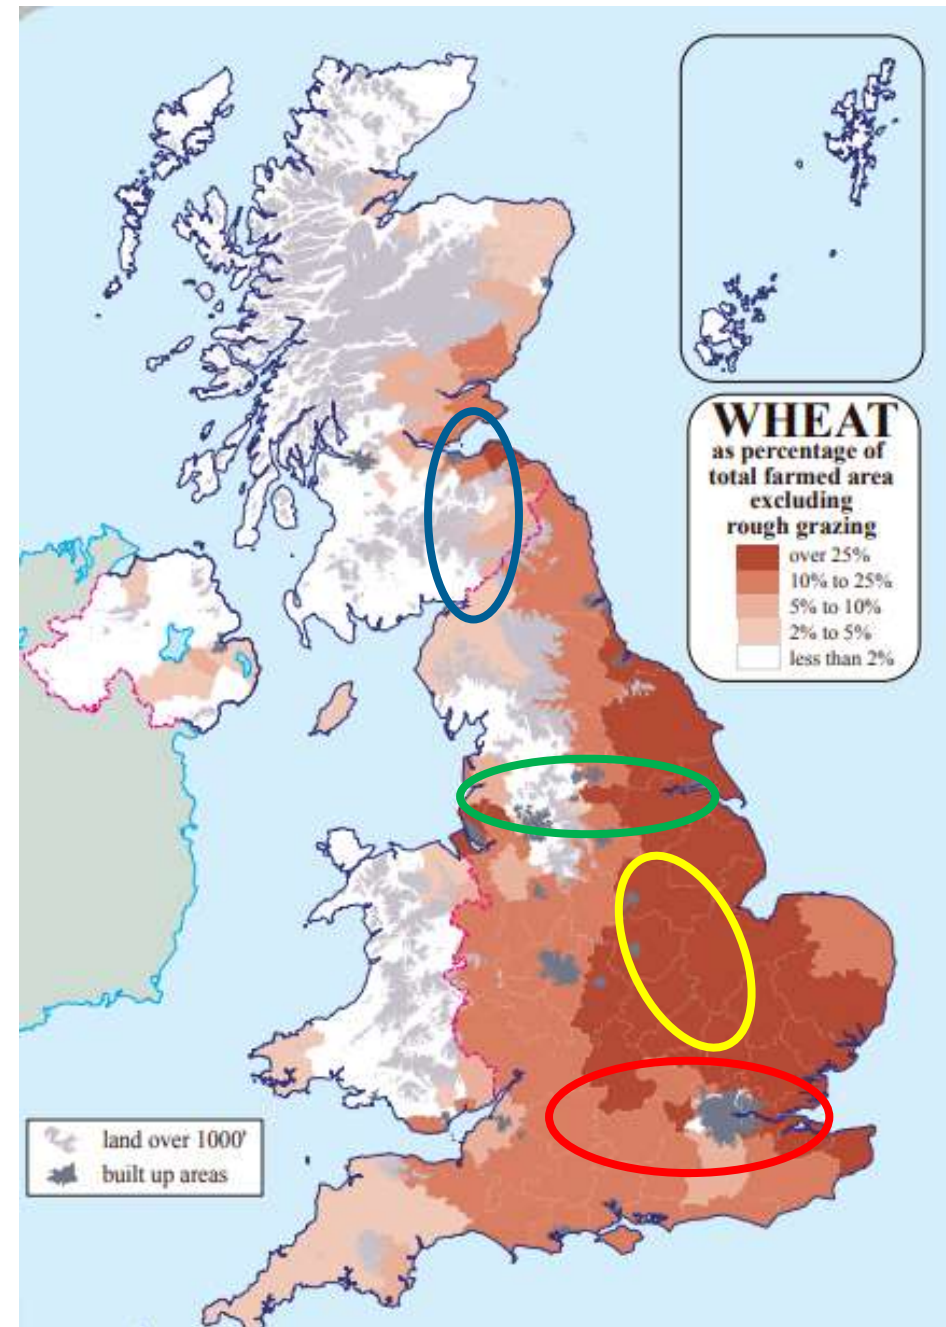

Soft wheat – UK demand

- 6 million Ginger Nuts and 6.5 million Custard Creams made every day!
- UK Flour millers require 800,000-1,000,000 tonnes soft wheat each year
- Starch/Alcohol/Ethanol millers require 2-3 million tonnes – preferably soft wheat
- Ongoing export requirement for **uks** 
- Flour milling demand for soft wheat is there and regular – and there are few alternatives...

UK Milling Wheat Geographical demand

- Scotland & Cumbria – 3 mills 
- M62 – 10 mills 
- Midlands – 9 mills 
- South – 10 mills 

nabim Varieties Working Group

Wheat testing

Flour/dough testing

Baking tests using various baking systems

Variety Candidates 2007-2018

nabim Varieties Working Group

- Cross-Industry group that agrees the “*nabim* Groups”
- See new variety samples from 5 years before large scale wheat supply
- Final commercial milling on Bread wheat before full Grp1 status given
- Gives certainty to grower and miller

EB Bradshaw & Sons - Traceability in Flour Milling

Stuart E. Bradshaw

Bell Mills, Driffield

Picturesque home of E B Bradshaw & Sons Limited

Original Bell Mills was completely destroyed by fire in 1949.

The mill was rebuilt between 1950-52, the first All Metal Mill in the world.

A segregated wheat store was built in 1955, giving the site a total of 98 wheat bins, 6,500T total capacity. Also two flat stores

All wheat bins have a cruciform on the hopper, allowing FIFO emptying.

Wheat can be tracked in time and space.

Once blended (a grist) this too can be tracked and traced.

For most flour, it is all about the wheat. Varieties are like different sized stones being placed into a dry stone wall.

Get it right, the wall stands for 100's of years. Get it wrong and it falls down.

This is the importance of keeping varieties separate.

Knowing what varieties work well on your farm -
both agronomically and economically.

Keeping accurate records.

Growing for markets.

Reliable and Resilient Haulage Sector

The whole of the Grain Chain needs :

Efficiently schedule and complete grain collections.

Supply accurate records.

Driver demographic is ageing.

ADM Feeds Your Food Business

ADM Milling UK – Technical challenges and opportunities

Simon Penson

CEREALS & OILSEEDS

ADM Agriculture Ltd.

ROLLE, January 17, 2019.

Archer Daniels Midland Company (NYSE: ADM) today announced it has signed an agreement to purchase the remaining 50 percent stake of Gleadell Agriculture Ltd., currently jointly owned by ADM and InVivo, including Gleadell's wholly owned subsidiary Dunns (Long Sutton) Ltd. ADM will merge Gleadell and Dunns with ADM Arkady, ADM's UK destination marketing business, and ADM Direct UK, ADM's specialist combinable crop origination business to create ADM Agriculture Ltd, thus strengthening ADM's presence across the UK.

The transaction will increase ADM's origination, storage and destination marketing capabilities in the UK, allowing it to serve as the trading partner of choice for even more farmers and customers.

Technical challenges in the milling sector

- **Availability of Milling Quality Wheat**
- **Food Safety**
- **Product Quality and Product Development**
- **Legal and Regulatory Compliance**

Food Safety Challenges: wheat

- **Contaminants**
 - Physical
 - Chemical
- **Mycotoxins**
- **(Acrylamide)**

Consumer Trends: Diversification and New Benefits

A bakers perspective on milling wheat and consumer expectations from the loaf

Eva Wheeler – Head of Technical – Allied Bakeries

Wheat made into bread since Ancient Egyptian times

.... So we should be experts by now!

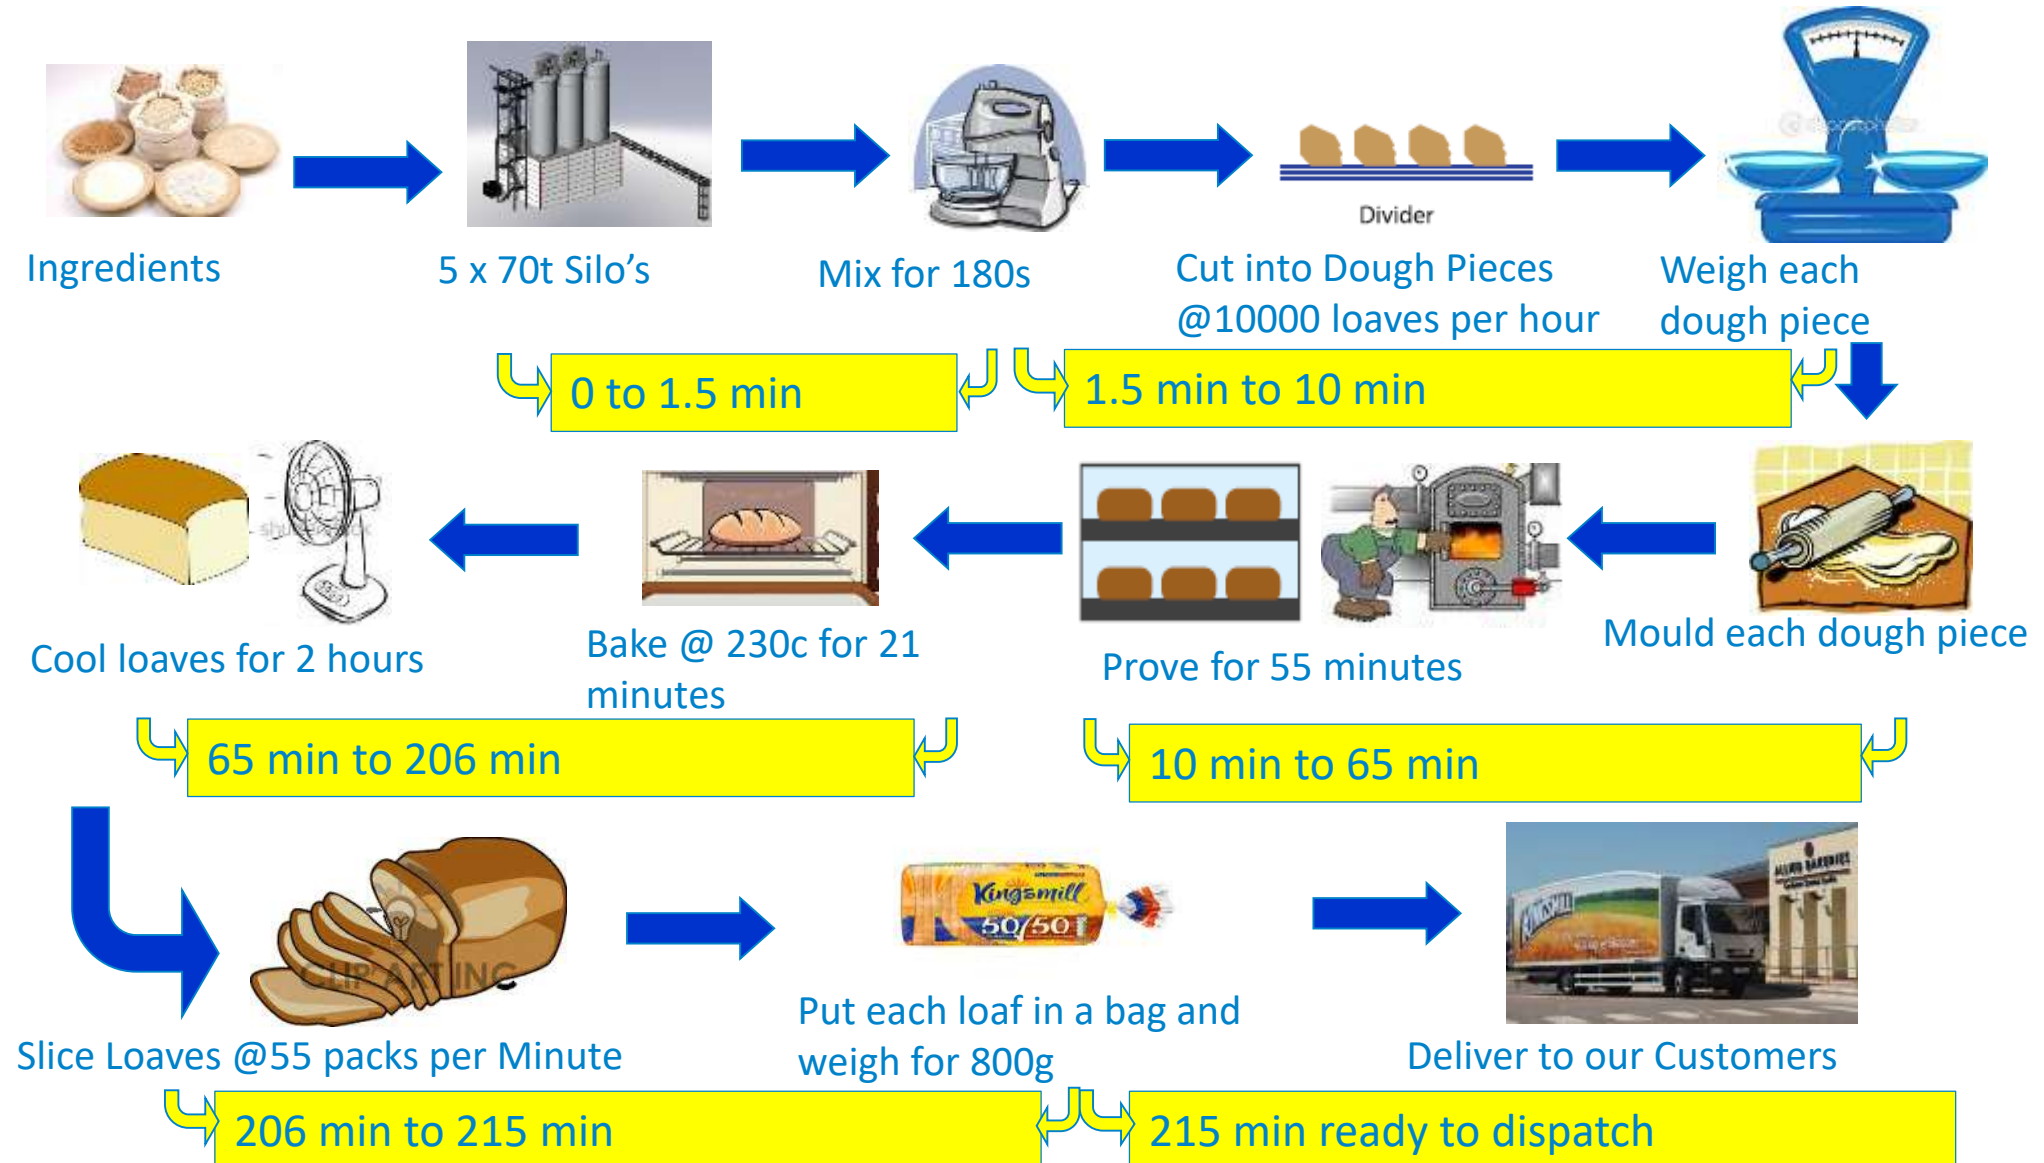

Challenges

100% UK every year
Harvest transition
High output Bakeries
Loaf quality changes

Shelf – life
Consistency
Salt reduction

Consistency is key in a continuous batch process making 10,000 loaves per hour

What's important for Bread Quality?

- ✓ Flour water absorption – Helps shelf life & yield
- ✓ Gluten quality – Helps dough development, crumb strength, oven spring, texture & whiteness
- ✓ Flour extraction process – Too much bran = collapse
- ✓ Natural flour enzymes – Can help or hinder
- ✓ Good dough rheology – Allows the bread to rise uniformly and helps moulding for good texture
- ✓ High Hagberg falling number – Stops sticky slices, gumming and high waste
- ✓ UK Group 1 Wheat varieties usually the best but blends of lower groups can add benefits and reduce costs
- ✓ At Harvest - Positive release through baking and quality checks is key & Consistency, Consistency, Consistency!!!!

A thin film of protein from flour (**gluten**)
forms a bubble

Yeast fills
The bubbles
with CO₂

Starch fills
the spaces
and provides
Stability

Salt strengthens gluten & stabilizes the dough

1. Create bubble structure (Mixing)
2. Increase the size of the bubbles, raise the dough (Proofing)
3. Set the structure (Baking)
4. Cool, slice & wrap At speed

Effect of Salt, Sugar & Sat Fat Reductions

HIGH

Strengthens gluten & stabilises the dough = better, stronger crumb structure and butterability.
Aids shelf life and Impacts Taste!

Too little and we lose control of the dough (sticky), big bread, stales faster, bland

Levels have reduced > 25% over 15 yrs driven by Dept of Health Targets & more to come!

MEDIUM

Most bakery products contain very little added sugar. Declared comes from fermentation

Pancakes sugar reduction interesting!
Texture, calorie myths & substitutes

LOW

Most of our bakery products are low in saturated fat so not an issue for us

Focus on Green Palm the bigger issue

Consumer expectations

- 1) Loaf Softness = freshness perception – The 3 second loaf squeeze test in store
- 2) Slice softness – loaf lasts @ 1 week
- 3) Butterability – Crumb Strength
- 4) Crumb resilience - good texture & Toast!
- 5) Even texture & colour – Too open and it will stale more quickly
- 6) Consistency – Bread is bought frequently so small differences are noticed
- 7) And yes ... Tastes good!

Wrapped bread is the single most consumed food item in British supermarkets, appearing in **1 in 3 meals**

Wrapped bread is an affordable and essential **everyday staple** for millions of families, appearing in more households than any other food item

Bread is eaten in **9.6 billion** meals a year, including **35%** of breakfasts & **34%** of lunches

Bakery is considered authentic, and part of a balanced diet, providing 19% of the UK's fibre, 10% of protein & 15% magnesium, folate calcium & iron intake

In Summary – Remember the 3 C's

Consumer

- Freshness = softness
- Shelf life
- Health trends
 - Fact vs. fiction
- Small differences noticed

Challenges

- Made & delivered everyday
- Small differences noticed
- Health targets make it more difficult
- Baking needed before you know the true Quality

Consistency

- Highly automated plant Bakeries
- Harvest transition
- Consistency of product and flour key

The 2018 YEN competition saw completed entries from 204 fields and 30 trial plots.

- The average grain yield for the Cereal YEN 2018 competition was 10.1 t/ha for absolute field yield.
- The average yield potential was 17.7 t/ha and the average % of potential yield achieved was 57%.
- Your entry yield of 9.5 t/ha ranked 123 for absolute field yield within all YEN field entries.
- This represents 52% of an estimated yield potential of 18.4 t/ha at your site in 2018, which ranked 132 for achieving the highest percent of potential yield within all YEN field entries.

| Rank | Grain yield (t/ha) | Rank | Grain yield (% potential) |
|------------|--------------------|------|---------------------------|
| 1 | 16.2 | 1 | 103% |
| 2 | 15.4 | 2 | 98% |
| 3 | 14.1 | 3 | 96% |
| Your entry | 123 9.5 | 132 | 52% |

CONTENTS

Our detailed analysis of your yield result is provided in the following pages, including comparisons with other YEN entries and with benchmarks taken from the AHDB Growth Guide and the AHDB Nutrient Management Guide (R8209). We hope that this helps you to identify aspects of your husbandry and growing conditions that offer possible routes to further yield enhancement on your land.

Our approach in this report is to consider yield potentials and growing conditions for crops in the 2017-18 season, then (new this year!) the agronomy of your crop, its development, the basic resources (light energy & water) available to it, its success in capturing these and in converting them to grain. Lastly we use grain analysis to provide a post-mortem on your crop's nutrition. If you were involved in tramline trials, we have also tabulated all results so you can compare your treatments easily.

POTENTIAL GRAIN YIELDS

*"The YEN exists to help you
to enhance your yields."*

The key to high yields amongst YEN entries has been accelerating crop growth. So our approach to enhancing yields is to work out what is limiting growth – light energy or water – and then develop ideas to target better green canopies or better rooting accordingly.

To estimate potential yields we assume a theoretically 'perfect' variety grown with 'inspired' husbandry on your land with its 2017-18 weather, achieving either:

- (i) 60% capture of light energy through this season (including some in August), and its conversion to 1.4 tonnes of biomass per hectare, or
- (ii) Capture of all the available water held in the soil to 1.5 m depth (or to rock if less) plus all rainfall from April to July, and conversion of each 20 mm into a tonne of biomass per hectare.

Taking the lesser of these two biomass amounts, we assume that a maximum of 60% can be used to form grain (this is the 'harvest index').

The maps below show potential grain yields for retentive and light soils in 2018. Potentials in arable areas would have commonly been water limited, even on medium soils. They ranged from 13 t/ha upwards so, on deep soils, high yields were theoretically possible everywhere.

Potential yields

2018
Retentive soils (with 260 mm AWC)

2018
Light soils (with 160 mm AWC)

¹ We are using weather data from [Japs](#) in 2018 and assumed deep soils with no irrigation. Note we have not yet processed long term met. data from Haris so cannot show a map of long-term average yield potentials.

The 2018 YEN Wheat Quality competition saw completed entries from 32 fields.

Thank you for submitting sufficient grain to be assessed for this award.

- Average grain yield for all Group 1 varieties entered in the YEN 2018 was 9.8 t/ha and average grain protein yield was 1.3 t/ha.
- Your entry yielded 9.8 t/ha grain and 1.3 t/ha of grain protein, which ranked 15 for protein yield within all YEN Group 1 entries.
- Your entry was included amongst the 12 finalists selected by the milling industry for rheology and baking tests this year.

This report provides results for your entry, summarises the procedures used to determine the YEN Wheat Quality Awards, and shows results for all the finalists.

The YEN Wheat Quality Award is sponsored and organised by nabim.
With thanks to the milling industry for the analysis of entries.

©ADAS2019

SHORT-LISTING & QUALITY TESTING METHODOLOGY

All YEN entries that were UK-grown nabim Group 1 varieties were eligible to enter the YEN Wheat Quality competition. The growers of these entries were sent a large sample container to fill with the required amount (5kg) for rheology and baking tests. As with all YEN entries, yields were determined and certified, and grain was tested for specific weight and protein concentration. In addition, samples of YEN Wheat Quality entries were sent for Hagberg Falling Number (HFN) determination and assessments were made of grain appearance and presence of impurities. Grain protein yield was calculated. In total there were 32 entrants. Eight of these did not have verifiable yields, lacked grain analytical data or did not provide enough sample, and were not included.

The remaining 24 entrants were initially sifted according to the grain analytical quality criteria of 12.5% protein, 76.0 kg/hl specific weight and 250s HFN. Typically, a 13.0% protein level would be used to sift entrants, but as this was a lower protein season a lower requirement was applied. 12 entrants did not meet these criteria and did not proceed to the second stage of the competition. Additionally, three entrants were significantly under the 5kg sample requirement and were excluded. All entrants scored well in terms of grain appearance and the presence of impurities so this was not a factor in sifting.

The remaining 12 entries were cleaned and reanalysed in a cereals laboratory prior to small-scale milling. Samples of the milled flour were tested for dough quality and test-baked using the Chorleywood Breadmaking Process (CBP) and both the '800g open top recipe' and the '500g 600g open top recipe'. These are two common breadmaking recipes used to assess Group 1 wheat and millers look for consistent performance across both bake types. Where less than 5kg of sample was submitted by entrants, there was not enough grain to carry out dough quality testing as well as test bakes.

The finalists were assessed by considering the yield, protein yield and the quality of flour, dough and baked bread. The results for all finalists can be seen in Table 1. Images of the baked loaves can be seen in Table 2.

WINNING ENTRIES

First place – This entry had the highest yield of 12.16 t/ha grain, the highest protein yield of 1.35 t/ha and demonstrated excellent grain analytical quality. Dough quality was good, although gluten was slightly too resistant, this was a feature of the 2018 wheat crop generally. Loaves from both baking systems were excellent, with white breadcrumb colour and good structure and texture. So, in conjunction with the high grain yield, this entry was judged to be the best overall.

Second place – This entry had the second-highest yield and protein yield of 11.83 t/ha and 1.32 t/ha respectively. Whilst there was insufficient sample to carry out dough analysis, and there was some slight coarseness seen in the crumb texture, the quality of the baked loaves was excellent.

Third place – This entry had the third-highest grain and protein yield of 10.06 t/ha and 1.30 t/ha respectively. Whilst the grain protein was higher than is usually optimal for UK breadmaking varieties, the baking quality was excellent with good loaf size, quality and structure. There was insufficient sample to carry out dough analysis.

Other finalists – A number of the other nine entries had good breadmaking quality, however, yields and protein yields were significantly lower than the top three entrants. From the results of the dough analysis, three entries (CF01008PS, CF00896 and CF01015) showed a gluten strength that was too tough and this was reflected in poor quality baked loaves. These entries had high grain protein, demonstrating that protein quality as well as quantity is critical to flour performance.

2

MILLING QUALITY RESULTS

The results for your entry and all other entries in the YEN Wheat Quality Competition 2018 are summarised below in box and whisker charts. The charts include critical or threshold values, if appropriate. The key to the charts is as follows:

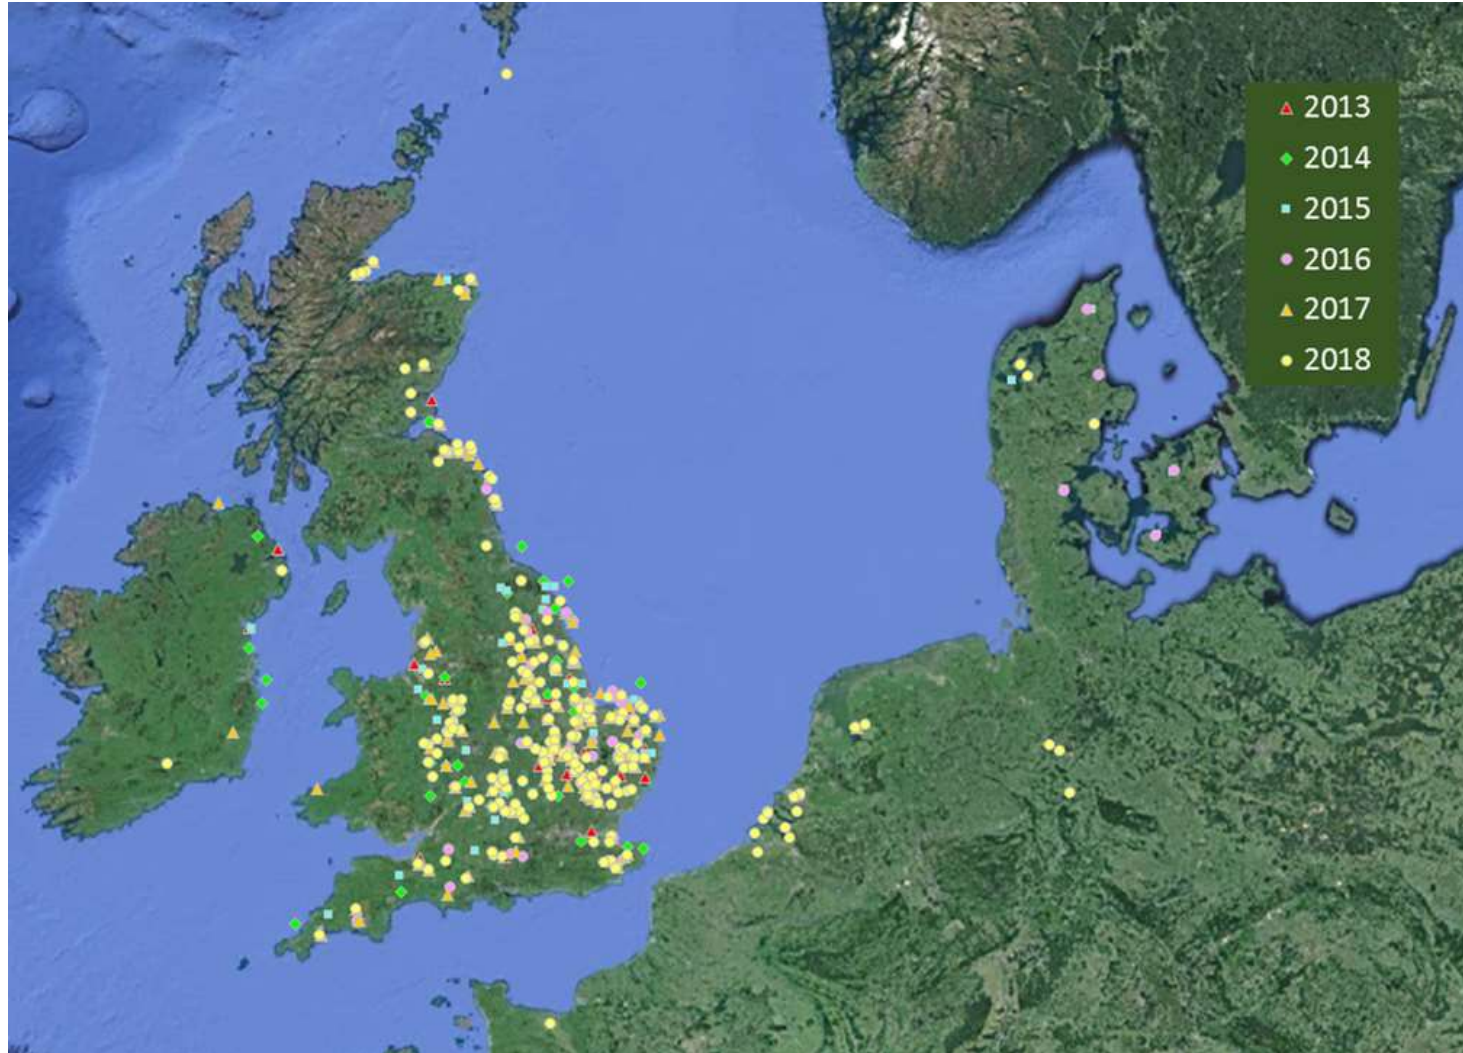

The 'whiskers' show the range of values from all YEN Wheat Quality Award entries in 2018 and the box shows the middle half of these values, with a line for the mid-value. The orange line shows the value for this entry and the red dashed line is a limit beyond which milling quality is reduced.

Summary
for yield

AHDB

- **15 t/ha is possible ... almost anywhere**
- It's less about what you spend, more about ...
'Attention to Detail'
- **Large yields come from large crops**
 - With more ears than average
... and tending to be taller, with greater straw N%
 - So important associations include good nutrition,
and control of disease & lodging risks
 - Husbandry factors associated with high yields include:
 - ... following a break crop
 - ... narrow row widths
 - ... applying slurry
 - ... adequate N use ... but liquid N (straight) was questionable
 - ... and several PGR applications.

Summary for Protein

Individual protein associations

Protein changes (%DM) in relation to ...

- **nabim group: Group 1 ~12.5%**
 - Group 2: -0.7% Group 3: -1.0% Group 4: -1.2%
- **Fertiliser N ... +0.5% per 100 kg/ha N**
- **Region: Scotland -0.6% or South West 0.6%**
- **Soil: Organic +1.4%, Shallow soils over chalk -0.8%**
- **Soil depth: -0.6% per metre**
- **Soil P : +~0.4% per index**
- No associations (yet) with fertiliser P, K or S, N fertiliser type, micronutrients, biostimulants, fungicides, PGRs, cultivation type, or grass history.
