Light leaf spot forecast data

About the forecast

The forecast shows the proportion of the oilseed rape crop (disease resistance rating of 5) estimated to have more than 25% of plants affected by LLS in the spring. A preliminary forecast is issued in the autumn. This forecast uses previous season pod incidence data, deviation from 30-year mean summer temperature data and 30-year mean rainfall data. In spring, the forecast is updated to reflect deviation in actual winter rainfall data from the 30-year mean.
