

# **RUSTWATCH – A European early warning system for wheat rust diseases**

Research and Innovation action Grant Agreement 773311

Coordinated by

Prof. Mogens Støvring Hovmøller, Aarhus University, Denmark

*UKCPVS stakeholders meeting, March 12, 2021  
presentation via Zoom*

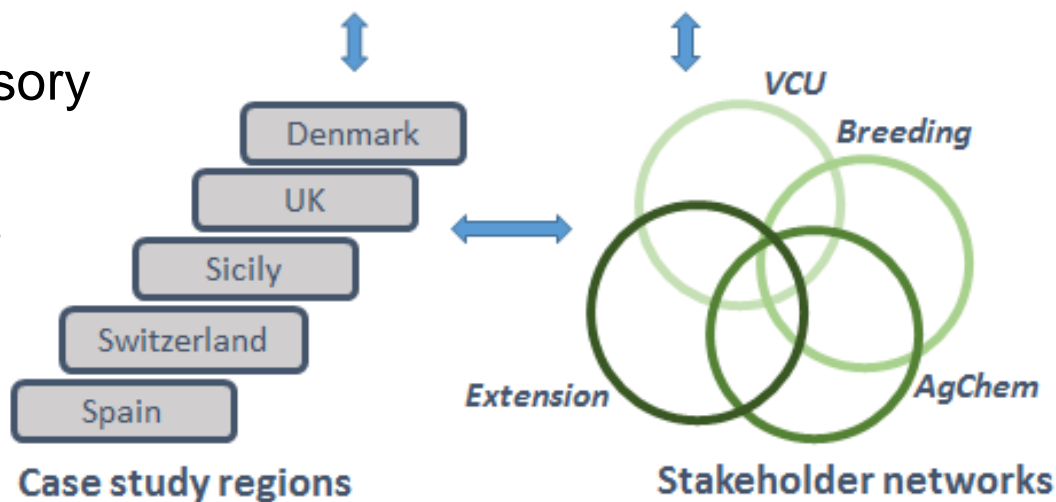

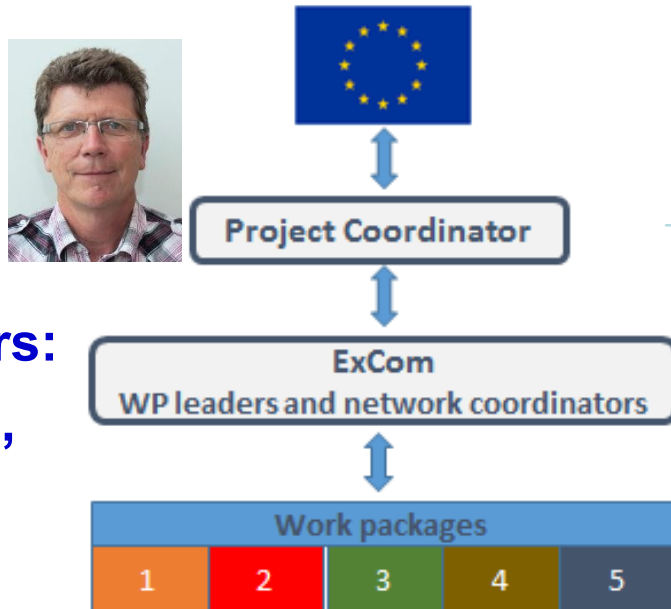

# RustWatch – early warning for wheat rust diseases

## Management and networks

### Management support team

- Emilia Alegria: Admin & budgets
- Annemarie F Justesen: Science
- Jens G Hansen: Communication & data management

**24 partners, 5 M €, 4 years:**  
**Yellow/stripe, brown/leaf,**  
**and black/stem rust**

- 12 universities/research institutes
- 5 agricultural advisory services
- 7 SMEs/industries

# Key features of RustWatch

- Stakeholder driven early-warning system
- Value chain from plant breeding to end-user farmer
- Main rust research and resistance breeding capacity in Europe
- Shared lab/experimental facilities: pathogen & host genotyping/ phenotyping, field trial sites, data management and information systems
- Linking pathogen features and dynamics with plant breeding and extension activities
- Early-warning validation and feed-back from case study regions

# Key features of RustWatch

## Pathogen characterisation and impact

- I. Rust sampling beyond countries with national rust diagnostic labs
- II. Alignment of lab methodologies, procedures and interpretation of results
- III. Impact assessment of new rust races

# Key features of RustWatch

## I. Rust sampling across wider areas:

- Representation of pathogen diversity & "unusual" disease observations

### TRIAL OUTPUT FOR TRAP NURSERY

Severity map

Severity table

Trial site map

YR & SR: Global Rust Reference Center  
([www.wheatrust.org](http://www.wheatrust.org))

LR: INRA

- 2020/21 season: >80 VCU winter wheat trial sites
- 7 wheat YR "differential" lines in common
- Additional sampling from farmers fields and plant breeding sites
- Data managed via the WheatRustToolbox
- Linking disease obs, race/ genotype result, and sample origin (host)

★ Rust diagnostic labs

# Key features of RustWatch

## II. Alignment of lab methodology, procedures and interpretation of result

### Aim:

- Rapid diagnosis of wheat rust on a national/regional scale
- Secure live isolates of "new" rusts for research (researchers)

### Procedure:

- Each national/regional lab isolates live isolates of stem rust
- Labs exchange information on alignment

## II. Alignment of methodologies, procedures and interpretation of results

## II. Alignment of methodologies, procedures and interpretation of results

### Races on single locations

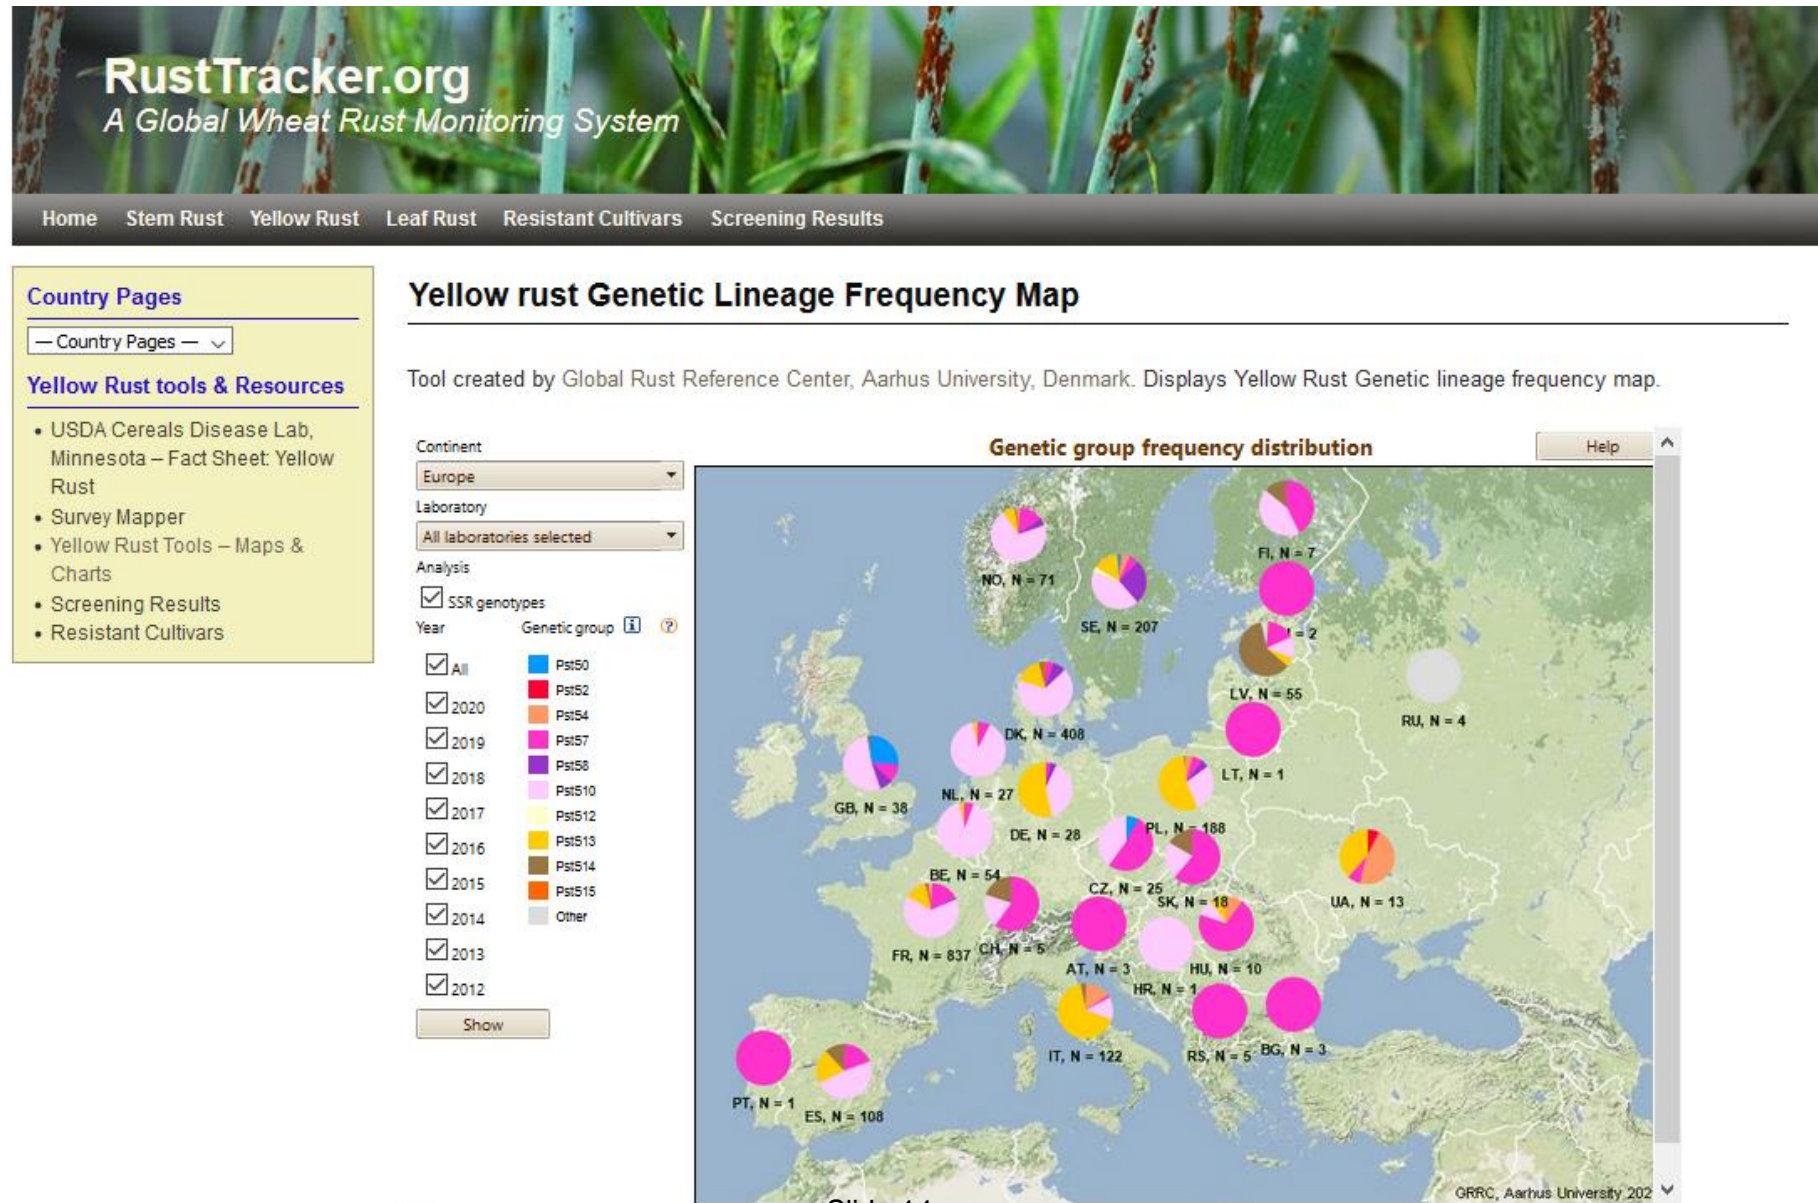

## II. Alignment of methodologies, procedures and interpretation of results

### Race Frequency Map

Data provider : GRRRC, Denmark: IHAR, Poland: INRAE, France: JKI, Germany: NIAB, United Kingdom.

## II. Alignment of methodologies, procedures and interpretation of results

# Key features of RustWatch

## II. Alignment of lab methodology, procedures and interpretation of result

### Conclusions

- Collaboration with VCU facilitated better and diversified sampling coverage in Europe
- Simple and robust genotyping platform using shared core set of primers
- Several genetic groups consisted of a single race only, others had multiple races
- Alignment essential for direct comparison of results
  - Tests of shared of isolates/DNA samples, including reference isolates
  - Identical/duplicate seed sources of core set of differentials
  - Regular physical/web workshops to discuss results and new findings

### III. Impact assessment of new rust races

Field nurseries of > 200 advanced breeding lines and cultivars at 8 locations in 3 years

Seedling and APR tests in green house (subset of lines)

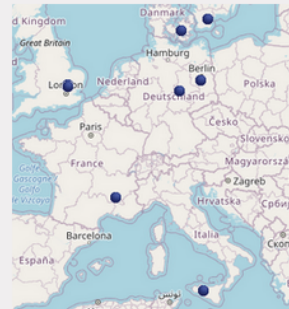

### III. Impact assessment of new rust races

## Field nurseries

## About the Field Nurseries

Approximately 250 winter wheat varieties and breeding lines were tested for susceptibility to novel emerging races of yellow rust (YR), leaf rust (LR) and stem rust (SR) under field conditions in both 2019 and 2020. The nurseries were conducted in DK (AU), UK (NIAB), DE (JKI), IT (AS.A.R.), FR (ARVALIS) and at three locations of the breeders' network in DE (BREUN), SW (LANTMÄNNEN) and UK (RAGT). The methodology used for this is described in the milestone report M3.13 'Sharing protocols between partners for evaluating adult plant resistance of varieties and breeding lines to rust diseases under field conditions'.

The results of the 2019 and 2020 field nurseries are published in two separate reports. The 2020 data were analysed using the Field Nursery Data Management System (FNDMS), a collaborative effort between WP3 and WP4. This system, stores the data, do quality control, analyses and visualises the data.

Below you will find output visualisation tools from the Field Nursery Data Management System and finally links to reports and the user guide and documentation report about proper use of the tools.

Summary results as severity scores across cultivars by disease, year, locations and seed provider
