

# Supply & Demand

## **Key points**

- UK wheat supply and demand remains finely balanced, with lower demand by Human & Industrial (H&I) consumers offsetting a decline in availability
- Demand for barley has increased for both animal feed and H&I, however, the surplus remains significantly higher than last year
- Maize imports have accelerated following initial delays with the animal feed sector the main recipient
- Forecast lower animal feed demand for oats and a conservative rate of exports suggest considerably higher end stocks

### Introduction

1. This release covers the second official estimates made by Defra of UK cereal supply and demand for 2013/14 (Appendix I). Comparisons are made in this note with the first estimates (27 Nov 2013). The next official review of the 2013/14 supply and demand will take place on 26 March.

2. Appendix 1 has been amended to split out Human & Industrial (H&I) and animal feed demand in the total cereals table for wheat, barley, maize and oats.

#### Wheat

3. UK wheat availability is forecast at **15.737Mt**, 1% lower than November's estimate, mainly due to lower production. UK wheat production was reduced to 11.92Mt in the final Defra Crop Production Survey, 10% lower than 2012/13.

4. Wheat imports are now estimated at 1.630Mt, slightly higher than the 1.615Mt forecast in November, but 45% lower than 2012/13. According to HMR&C 1.180Mt of wheat was imported between July and November 2013, 14% more than the corresponding period in 2012/13, although the rate of imports decreased significantly in November. These estimates assume the declining trend will continue as millers return to home-grown supplies, but import pace for the rest of the season is susceptible to the regional price competitiveness of the UK against other origins.

5. Wheat usage for Human and Industrial (H&I) consumption is estimated at 7.498Mt, 307Kt lower than in November and 1% down on the year. This decline is due to lower flour and

bioethanol production, which are not offset by marginally higher use by distillers and other users. A decline in flour production has been observed so far this season and is forecast to only slightly recover during the rest of the season. Some of the decline in wheat usage can be attributed to improved UK quality which has allowed flour extraction rates and home-grown wheat incorporation to move towards more typical levels.

6. **Bioethanol production** continues to be a large uncertainty for UK demand, but commercial conditions and operational performance to date currently support a lower forecast than that estimated in November.

7. Total animal demand feed was surprisingly strong in the early part of the season, with year-on-year growth reported. However, milder winter conditions compared with 2012/13, as well as better forage availability, are now weakening monthly grain demand. This is despite strength in the dairy and poultry sectors due to higher milk prices and chick placings. The poultry sector is showing a downward trend in use of feed produced by Integrated Poultry Units (IPUs), however this is more than offset by feed produced by retail compounders resulting in overall growth in the sector.

8. The amount of **wheat used in animal feed** has been increased by 100Kt from November's estimate to 6.003Mt. This is down 12% year-on-year, reflective of the wheat price premium over barley, maize and oats. Growth of barley in rations occurred fairly rapidly post-harvest but displacement of wheat by maize has only increased significantly in recent months. The

higher levels of maize inclusion are forecast to be sustained for the season but demand will be determined by price relationships and hence is challenging to forecast.

9. The wheat availability and demand balance is now estimated at 1.880Mt, 36% lower than in 2012/13, but marginally higher (42Kt) than the forecast in November as the decline in demand offsets the lower availability. With operating stock at 1.48Mt, surplus available for exports or free stock is slightly higher than November at 400Kt. To the end of November, HMR&C report that 167Kt had been exported.

# Barley

10. A slight drop (10Kt) in the **barley production figure to 7.092Mt**, the final result of the <u>Defra Crop Production Survey</u>, has led to total barley availability dropping by the same amount to 8.154Mt. Compared with 2012/13, barley availability remains 22% higher.

11. Barley for H&I consumption is revised 40Kt higher than November's estimate to reach 1.897Mt, representing year-on-year growth of 3%. Usage data for between July and November 2013 revealed a 6% increase compared with July-November 2012, although the month-on-month increase between 2012 and 2013 was lower for November, and the growth rate is expected to be slower in the second half of the season.

12. A further 80Kt of barley is expected to be used in animal feed, compared with the estimate made in November, bringing the total for the season to 3.542Mt (8% higher year-on-year). Barley's discount to feed wheat is the underlying factor.

13. The barley supply and demand balance is now reduced to 2.529Mt, 130Kt lower than November's estimate, but still 83% higher compared with last season. With the operating stock requirement remaining at 713Kt, this means that the surplus available for export or to carry over as free stock now stands at 1.816Mt. Cumulative barley exports for the season to November are 636Kt, although the pace has subsequently decelerated as competition from the Southern Hemisphere harvest makes an impact.

# Maize

14. As a result of higher demand estimates, maize imports are forecast at 1.726Mt, a 146Kt increase compared with November. As at November 2013, cumulative imports reached 739Kt for the season, with a steep increase seen in November. This shift occurred due to maize entering the UK following the initial harvest delays in France and Ukraine. Maize usage in animal feed is thus increased by 156Kt compared with November's estimate, bringing the total to 1.762Mt (13% higher than in 2012/13). A slight decline of 10Kt is seen for H&I consumption (which is now at 475Kt) compared with November's forecast

# Oats

15. Oat availability is reduced by 11Kt from November's forecast to 1.069Mt as a result of the final results of the <u>Defra Crop Production Survey</u> showing production at 964Kt. Imports remain unchanged from November at 30Kt.

16. H&I demand is also unchanged at 505Kt, but consumption of oats in animal feed is decreased by 87Kt to 310Kt compared with the 397Kt forecast in November. Although the price of oats is competitive with other feed grains, increased use in animal feed is limited, to some extent, by technical practicalities. Nevertheless, oat consumption in animal feed is up 61% year-onyear.

17. The availability and demand balance, at 231Kt, is 76Kt higher than that forecast in November, with lower demand in animal feed more than offsetting the slight reduction in production. Compared with 2012/13, the oat balance is more than 2.5 times higher. Exports are reduced from 50Kt in November to 40Kt, as pace so far has been relatively lacklustre. End-season stocks are thus increased by 85Kt from November to reach 190Kt, 154% higher year- on-year.

# **Additional Data**

18. Appendix II shows cumulative usage and trade data to end-November. This release and related information can be found at <u>www.hgca.com/markets</u>. Monthly cereal usage data can be found on the DEFRA website at <u>www.defra.gov.uk/statistics/foodfarm/latest-statistical-releases</u>.

(14)	Estimated Operating stock requirement (wheat & barley only)	n/a	2,109	2,163	2,163	2.193	30	1%		
(15)	Free stock for wheat and barley	n/a	326	1.020	-,	-,		•		
(16)	Surplus available for either export or free stock (all)	n/a	3,728	2.218	2.434	2.306	-128	4%		

(a) These are revised during the year. Figures rounded to the nearest 1000 tonnes
(b) Split of exports, intervention and total commercial end-season stocks only published for historical seasons
(c) 2011/12 new format: Estimated Operating Stocks Requirement is a calculated estimate of the minimum tonnage that users of grain require to get through to a point at which new crop can be utilised
(d) 2011/12 new format: Free stock is the stock evailable after both exports and estimated operating stock requirements have been fulfilled.
(e) Includes mainly ne, trilicale, mixed grain and sorghum.
(f) 2012/13 new format: Free stock is the stock calculated estimate operating stock requirements have been fulfilled.
(g) 2013/14 new format: For total cereals, H&I and animal feed usage for wheat, barley, maize and oats is split out
