

Innovative and Disruptive Technologies for
Agri-food Supply Chains

Blockchain: Is it going to be good for us?

Dr Beth Kewell, Research Fellow, CoDE,
Mr Travis Street, Teaching Fellow, CoDE,
Surrey Business School, The University of Surrey.

How Blockchain Works...

Blockchain: A Promissory Technology?

Disruption

- Has the potential to disrupt every business sector and every profession

Reskilling will be a requirement for many

What it does...

- Makes transactions highly secure and immutable thanks to its underlying cryptography
- Offers 100% transparency (if that's what you want)
- Can be used in conjunction with AI, 5G and I o T

This is why it's timely

Dampeners

- The power problem (it uses vast amounts of energy)
- Scale-down (of equipment size and running costs)
- Scale-up in ways that make it practical for businesses and consumers

Reality check: the above represents a significant scientific chasm

Blockchain/ Permissioned Ledger Usecases

- Finance (e.g. remittances)
 - Law (e.g. The Land Registry)
 - Manufacturing (e.g. automotive)
 - Extraction industries (e.g. diamonds)
 - Health (e.g. data analytics/wearables)
 - Energy (e.g. renewables)
 - Food (e.g. Provenance)
 - Conservation (e.g. wildlife tracking)
 - Artisan / craft industries (e.g. preserving Malaysian weaving traditions)
 - Misc (e.g. weddings!)

While blockchain technology has been in use since 2009, this chart shows that its has only entered into the mainstream since 2016:

Blankety Blank...??

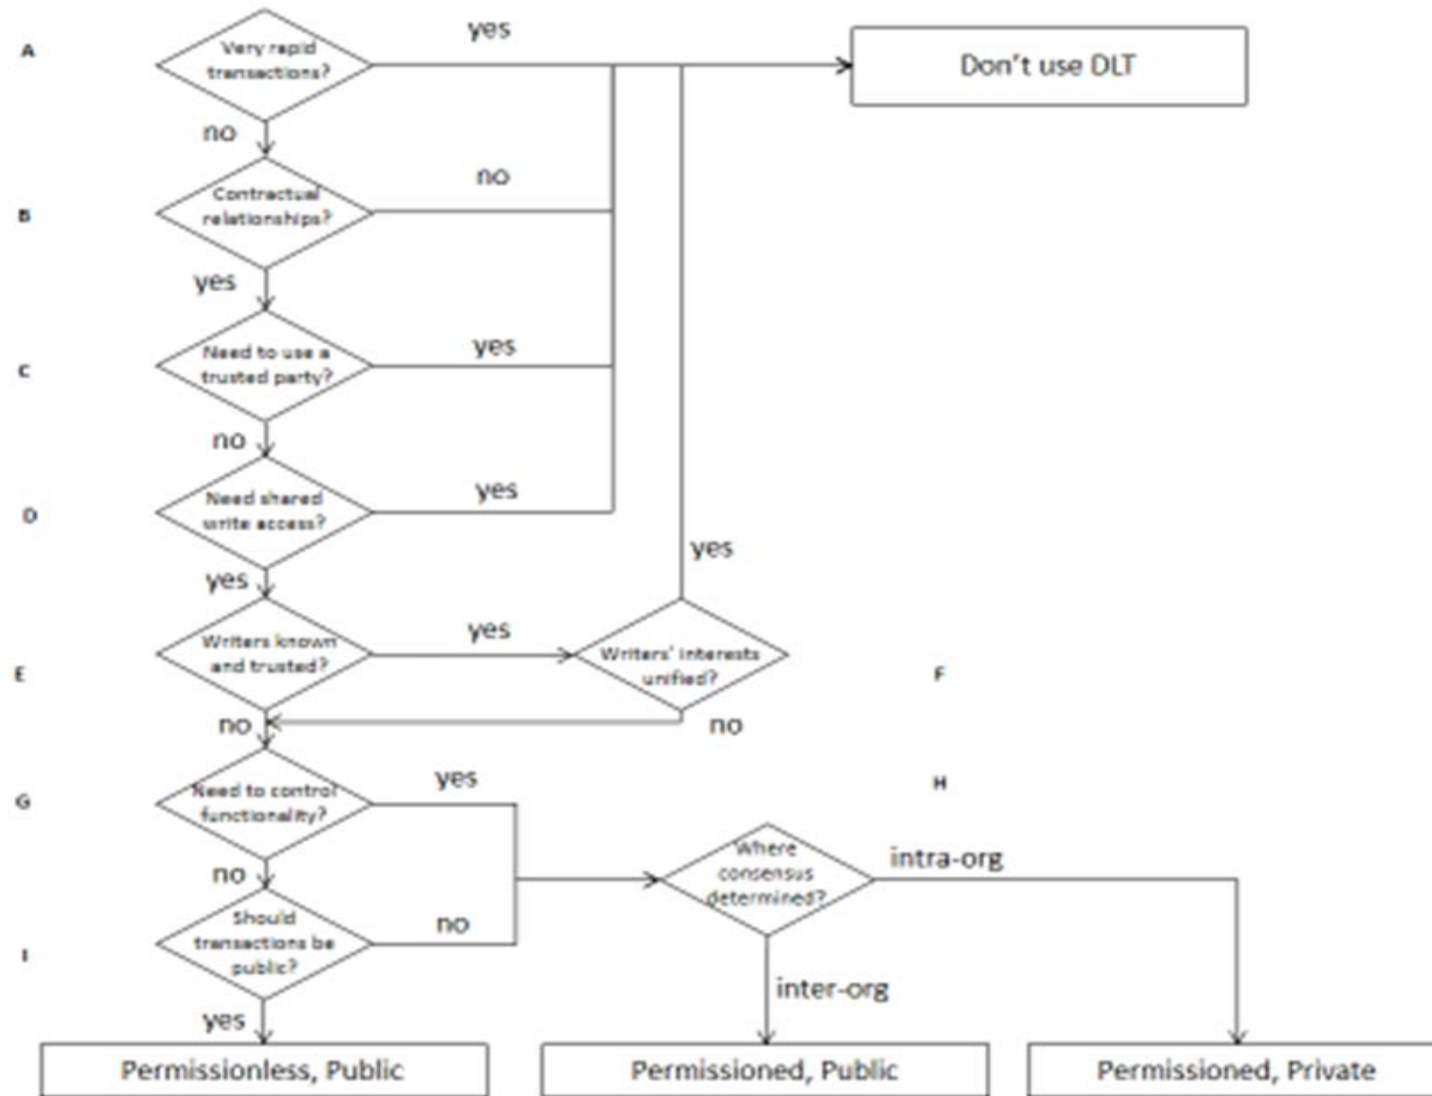

Example: Distributed (or permissioned) ledger technology could finally solve ___ and ___. It can reimagine ___. Having an unchangeable record can enable _____ that will _____. The emerging use cases span the gamut from _____, _____, _____ and _____ to _____ and _____.

What would you change if you had a permissioned ledger at your disposal?

Key affordances:

- **Immutability** meaning that information is **tamper proof** and can never be altered nor erased.
- **Traceability** based on being able to **see everything** that's moving through the blockchain / across the ledger at a glance.
- **Sensor** technology linked to the blockchain.
- **Wearable devices** linked to the blockchain.

Is blockchain right for you?

Mauil, R., Godsiff, P., Mulligan, C., Brown, A., and Kewell, B. (2017) Distributed ledger technology: Applications and implications. Strategic Change, September 2017, Wiley. DOI: 10.1002/jsc.2148

Blockchain 4 Good?

Kranzberg's Laws

- Technology isn't moral...but it can be used to advance social and environmental wellbeing

B4G examples

Identity provision (UN refugee programme)
Aid financing
Remittances
Micro-entrepreneurship (egs. farming and solar energy)

Moral impetus

- A force for good that could tame 'wicked problems' which defy resolution by conventional means

Batchblock – <https://batchblock.com>

- Mite resistance to Acaricide is on the rise in Uganda due to either improper use and dilution of the concentrate (i.e. spraying mites with a dilution that is not strong enough to eradicate the pest), which is an issue from an educational standpoint, or product tampering (i.e.. the product intended for use is a forgery). In some cases, both cases may play a role in the rise of mite resistance.
- Batch Block will develop a single use case around the latter scenario; tracking a package of Acaricide to remove the uncertainty of its provenance. Batch Block will track the package from its production facility, to import/export vessels, and finally to the end-point destination(s). These end-point destinations may include small pharmacies, and/or livestock chemical distributors.

Thank you for your time!

Any questions?
